OAKLAND, CA 94612
949.450.2525

MEMORANDUM

To:	Paul Kamboj, Two Guys Food and Fuel
From:	Jonathan Leech, Dudek
Subject:	Noise Assessment for the Daniels Center Project
Date:	October 27, 2022
Attachments:	A – Ambient Noise Measurement Data
	B – Construction Noise Modeling Files
	C – On-Site Operational Noise Modeling Files
	D – Off-Site Traffic Noise Modeling Files

1 Introduction

1.1 Purpose

Consistent with the approved scope of work, this concise technical memorandum prepared for the Daniels Center (Project) proposed to be located at 2125 Daniels Street in the City of Manteca (City) includes as follows:

- Summarized measurement results from an outdoor ambient sound pressure level (SPL) survey in the vicinity of the Project.
- A summary of modeled noise levels from construction of the Project, at the residential receptors in the immediate Project vicinity, as compared to ambient noise levels and recommended FTA limits.
- A presentation of predicted aggregate noise levels at nearby existing residential receptors attributed to operation of the proposed facility, as compared to ambient noise levels and applicable local noise regulations.
- A summary of project-related traffic noise increases along roadways to which the project would contribute trips, as compared to commonly applied thresholds.
- A summary of calculated vibration levels from construction of the Project, at the residential receptors in the immediate vicinity of the Project, as compared to applicable standards.

In summary, and based on Project design information to date, Dudek has determined that operational noise from the proposed Project as depicted on the Project site plan (K12 Architects, June 2021) would be in compliance with local regulations at the closest adjacent residences, while Project-related increases in off-site traffic noise levels would not be significant (remaining less than a noticeable change in the ambient noise environment). In addition, construction of the Project would generate noise and vibration levels that would be less than significant.

1.2 Project Setting

The Daniels Center Project is proposed to be developed at 2125 Daniels Street, on a currently vacant parcel at the northwest corner of the Airport Way and Daniels Street Intersection. Figure 1 at the end of the report provides the Regional and Local Setting of the Project site. A shopping center containing a Costco store, a Kohl's store, and other

retail shops is located along the southern side of Daniels Street opposite the Project site. Several restaurants and a gas station occupy the property at the southeastern corner of the Daniels Street and Airport Way intersection, to the southeast of the Project site. Vacant property exists along the eastern side of Airport Way opposite the Project site, with a residential neighborhood along the east side of Fishback Road; residences in this neighborhood are located at distances ranging from approximately 800 to 1,000 feet from the Project site. One undeveloped parcel of land is located to the north of the Project site, with rural residences on the next two parcels north of the Project; the existing residences are located at distances of approximately 200 and 365 feet from the Project site northern property boundary. These residences are the closest noise-sensitive receivers to the Project site. Vacant land is also situated to the west of the Project site, with a baseball fields complex located at approximately 1,000 feet from the western boundary of the Project site. The proposed Project consists of a convenience store, fueling pumps, car wash, and quick-serve restaurant. Figure 2 at the end of the report illustrates the Site Plan for the proposed facility. Figure 3 illustrates the location of short-term measurements conducted adjacent to vicinity residences to establish the existing ambient noise levels exterior to the residences.

1.3 Acoustical Fundamentals

Although the terms may be used interchangeably in the right context, "sound" is defined as any gas or fluid pressure variation detected by the human ear, and "noise" is unwanted sound. The preferred unit for measuring sound is the decibel (dB), which by way of expressing the ratio of sound pressures to a reference value logarithmically enables a wide range of audible sound to be evaluated and discussed conveniently. On the low end of this range, zero dB is not the absence of sound energy, but instead corresponds approximately to the threshold of average healthy human hearing; and, on the upper end, 120–140 dB corresponds to an average person's threshold of pain.

The human ear is not equally responsive to all frequencies of the audible sound spectrum. An electronic filter is normally used when taking noise measurements that de-emphasizes certain frequencies in a manner that mimics the human ear's response to sound; this method is referred to as A-weighting. Sound levels expressed under the A-weighted system are sometimes designated dBA. All sound levels discussed in this report are A-weighted.

The equivalent continuous sound level (L_{eq}) is a single dB value which, if held constant during the specified time period, would represent the same total acoustical energy of a fluctuating noise level over that same time period; this is also known as the "average" sound level. L_{eq} values are commonly expressed for periods of one hour, but longer or shorter time periods may be specified. Another descriptor is maximum sound level (L_{max}), which is the greatest sound level measured during a designated time interval or event. The minimum sound level (L_{min}) is the lowest measured level and often called the floor of a measurement period.

Unlike the L_{eq}, L_{max}, and L_{min} metrics, L_{dn} and CNEL descriptors always represent 24-hour periods and differ from a 24-hour L_{eq} value because they apply a time-weighted factor designed to emphasize noise events that occur during the non-daytime hours (when speech and sleep disturbance is of more concern). *Time weighted* refers to the fact that L_{dn} and CNEL penalize noise that occurs during certain sensitive periods. In the case of CNEL, noise occurring during the daytime (7:00 a.m. to 7:00 p.m.) receives no penalty. Noise during the evening (7:00 p.m. to 10:00 p.m.) is penalized by adding 5 dB to the actual levels, and nighttime (10:00 p.m. to 7:00 a.m.) noise is penalized by adding 10 dB to the actual levels. L_{dn} differs from CNEL in that the daytime period is longer (defined instead as 7:00 a.m. to 10:00 p.m.), thus eliminating the dB adjustment for the evening period. L_{dn} and CNEL are the predominant criteria used to measure roadway noise affecting residential receptors. These two metrics generally differ from one another by no more than 0.5–1 dB and are often considered or actually defined as being essentially equivalent by many jurisdictions.

1.3.1 Exterior Noise Attenuation

Noise sources are classified in two forms: (1) point sources, such as stationary equipment or a group of construction vehicles and equipment working within a spatially limited area at a given time; and (2) line sources, such as a roadway with a large number of pass-by sources (motor vehicles). Sound generated by a point source typically diminishes (attenuates) at a rate of 6.0 dBA for each doubling of distance from the source to the receptor at acoustically "hard" sites and at a rate of 7.5 dBA for each doubling of distance from source to receptor at acoustically "soft" sites (Caltrans 2009). Sound generated by a line source (i.e., a roadway) typically attenuates at a rate of 3 dBA and 4.5 dBA per doubling distance, for hard and soft sites, respectively (Caltrans 2009). Sound levels can also be attenuated by human-made or natural barriers. For the purpose of a sound attenuation discussion, a hard or reflective site does not provide any excess ground-effect attenuation and is characteristic of asphalt or concrete ground surfaces, as well as very hard-packed soils. An acoustically soft or absorptive site is characteristic of unpaved loose soil or vegetated ground.

With respect to examples of this distance-attenuation relationship for exterior noise, a 62-dBA noise level measured at 50 feet from a vehicle vacuum station within a paved site would diminish to 56 dBA at 100 feet from the source, and to 50 dBA at 200 feet from the source. This scenario is addressed by the point source attenuation for a hard site (6 dBA with each doubling of the distance). For the scenario where soft-site conditions exist between the point source and receptor, represented by open ground between Project site and receiver, an attenuation rate of 7.5 dBA per doubling of distance would apply; the vacuum noise measured as a 62 dBA at 50 feet would diminish to 54.5 dBA at 100 feet from the source and to 47 dBA at 200 feet from the source, where soft ground with or without vegetation exists between the sound source and the receptor location.

1.3.2 Vibration Characteristics

Per the Caltrans Transportation and Construction Vibration Guidance Manual (2020), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment).

Peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal and is expressed in inches/second (in/sec). PPV is most frequently used to describe vibration impacts to buildings but can also be used to quantify vibration annoyance potential for humans. Caltrans has established a human annoyance vibration threshold of 0.24 in/sec PPV (distinctly perceptible level) for construction-related vibration levels (Caltrans 2020). The Caltrans threshold for potential damage to residential structures is 0.5 in/sec PPV (Caltrans 2020).

1.4 Noise Regulation in Manteca

1.4.1 Municipal Code

Title 17 of the Manteca Municipal Code (MMC) addresses zoning. Chapter 17.58 establishes Performance Standards based on each zone district. Section 17.58.050 (Noise Standards) establishes the maximum noise levels allowed within each zone district, and for stationary noise sources that could affect neighboring properties. The following noise limits are applicable to Project, as determined at the property boundary for each parcel in the vicinity of the Project site.

B. Noise Standards. The maximum sound level generated by any use or activity as measured at the point of measurement as defined in Section 17.58.030 (Points of Measurement) shall not exceed the levels

established in Table 17.58.050-1 (Maximum Permissible Sound Pressure Levels) based on the use that is receiving the noise (e.g., residential use receiving noise generated by an industrial use).

MANTECA MUNICIPAL CODE TABLE 17.58.050-1 MAXIMUM PERMISSIBLE SOUND PRESSURE LEVELS		
Receiving Land Use Category	Time Period	Maximum Allowable Noise Levels (L_{dn}/CNEL)
Single-Family and Limited Multiple-Family	10:00 p.m. – 7:00 a.m.	50 dBA
	7:00 a.m. – 10:00 p.m.	60 dBA
Multiple-Family, Public Institution, and Neighborhood Commercial	10:00 p.m. – 7:00 a.m.	55 dBA
	7:00 a.m. – 10:00 p.m.	60 dBA
Medium and Heavy Commercial	10:00 p.m. – 7:00 a.m.	60 dBA
	7:00 a.m. – 10:00 p.m.	65 dBA

The noise levels in the above table are interpreted as an hourly average (L_{eq}) metric. Using Single-Family and Limited Multiple-Family as an example, employing the identified values as an hourly average would result in a 24-hour L_{dn} value of 60 dBA, which correlates well to the single-family exterior exposure limits in the Manteca General plan Noise Element.

Based on Table 17.58.50-1, Project noise would be restricted to no greater than 60 dBA L_{eq} during the daytime and 50 dBA L_{eq} during the nighttime, at the residential property boundaries closest to the Project site for each vicinity residential parcel. Because equipment will operate in the overnight period as well as in the daytime, noise control for on-site operations must ensure that operational noise levels comply with the more stringent 50 dBA L_{eq} limit at the residences. For commercial properties south and southeast, Project noise would be restricted to no greater than 65 dBA L_{eq} during the daytime and 60 dBA L_{eq} during the nighttime, at the adjacent commercial property boundaries. Because equipment will operate in the overnight period as well as in the daytime, noise control for on-site operations must ensure that operational noise levels comply with the more stringent 60 dBA L_{eq} limit at the adjacent commercial properties.

MMC Section 17.58.50.D outlines prohibited activities. The following would apply to construction activities for the Project.

E. Prohibited Activities. The following acts shall be a violation of this Chapter.

1. Construction Noise. Operating or causing the operation of tools or equipment on private property used in alteration, construction, demolition, drilling, or repair work daily between the hours of 7:00 p.m. and 7:00 a.m., so that the sound creates a noise disturbance across a residential property line, except for emergency work of public service utilities.

Based upon the above, construction of the Project would be restricted to the hours between 7:00 a.m. and 7:00 p.m. daily, unless it is demonstrated that construction noise would be no greater than ambient noise levels at residences in the vicinity of the Project.

1.4.2 General Plan Noise Element

The noise element contains several policies applicable to the Project, as presented below.

N-P-7: Noise level criteria applied to land uses other than residential or other noise-sensitive uses shall be consistent with noise performance levels of Table 9-1 and Table 9-2 [NOTE: Table 9-2 was superseded with adoption of MMC Section 17.58.050 (Noise Standards)].

NOISE ELEMENT TABLE 9-1 MAXIMUM ALLOWABLE NOISE EXPOSURE FOR MOBILE SOURCES	
Land Use Category	Ldn / CNEL dBA
Residential	60
Transient Lodging	60
Hospitals, Nursing Homes	60
Churches, Music Halls	60
Office Buildings	65
Playgrounds, Neighborhood Parks	70

N-I-3. In making a determination of impact under the California Environmental Quality Act (CEQA), a substantial increase will occur if ambient noise levels are increased by 10 dB or more. An increase from 5-10 dB may be substantial. Factors to be considered in determining the significance of increases from 5-10 dB include:

- the resulting noise levels
- the duration and frequency of the noise
- the number of people affected
- the land use designation of the affected receptor sites
- public reactions or controversy as demonstrated at workshops or hearings, or by correspondence
- prior CEQA determinations by other agencies specific to the project

2 Baseline Sound Level Survey

On October 5, 2022, Dudek conducted short-term (e.g., less than one hour in duration) sound pressure level measurements adjacent to several residential land uses in the Project vicinity, in order to characterize the existing exterior ambient noise levels at these residences that could be impacted by Project on-site noise sources or Project traffic contributions to area roadways. The measurement locations are depicted in Figure 3 (at the end of this report). The closest residence to the Project site is represented by ST2; the closest residences east of the Project site are represented by ST4; and ST1 and ST3 represent residences located adjacent to roadways to which the project would contribute trips.

The measurements were conducted using a SoftdB brand Piccolo II Type 2 Sound Level Meter. Type 2 sound-level meters have precision accuracy that is suitable for all types of environmental noise evaluation. The sound-level meter was calibrated before and after use in the field for these measurements. The sound level meter was

configured to record data for one-minute intervals; total duration of measurements at each location ranged from 10 to 30 minutes, based upon the number of vehicles on the adjacent roadway passing the measurement point. Sound level metrics including L_{eq}. L_{max}, L_{min}, were recorded for each one-minute period. Data logs for each of the four measurement locations are included in Attachment A. Table 1 presents the baseline sound level survey results as the average (L_{eq}) across the duration of the measurement at each location for ST1 through ST4. Refer to Attachment A for the complete data logs from the sound level meter over the measurement period.

Table 1: Measured Sound Levels in Project Vicinity

Site	Average Noise Level Across Measure Duration (dBA L_{eq})
Measure Location ST1	64
Measure Location ST2	70
Measure Location ST3	63
Measure Location ST4	60

Measured sound levels were very dependent upon traffic along the roadway adjacent to the measurement point, which is expected due to traffic noise typically being a primary contributor to the ambient noise environment in an urban setting. ST2 was located adjacent to Airport Way, a heavily travelled roadway, and therefore exhibited the highest noise levels in the survey. Traffic-related sound levels tend to be relatively constant during the day, decreasing in the evening and overnight period.

3. Project Description

The proposed Project consists of a quick-serve restaurant, convenience store, fueling pumps, and car wash. Typically, a carwash would include one self-serve vehicle vacuum station, which we have also included in the noise analysis. Refer to Figure 2 (at the end of the report) for the Site Plan illustrating proposed facility components.

It would make sense to place a vehicle vacuum station near the entrance to the car wash, so we have situated the vacuum sound source in the parking stall immediately to the east of the car wash entrance. The car wash entry is on the west end of the tunnel, which is oriented west/east, and the exit is at the east end. The car wash blow dryer would be just inside the building at the east, exit end. Refer to Figure 2 for the configuration of these components.

Noise generating components of the project include the vehicle blow dryer, located just inside the exit of the car wash tunnel, the one vacuum station, and a roof-mounted HVAC package unit on each of the two proposed commercial spaces. Other equipment inside the wash tunnel produces far lower sound levels than the blower. The carwash blower can therefore be used as the worst-case sound source for the carwash operation. The vacuum could be in use by patrons while the blower is operating. Lastly, both HVAC package units could be in operation while the car wash and vehicle vacuum are in use. Therefore, as a worst case, the operational noise level was assessed with all equipment operating simultaneously and continuously.

4. Construction Noise

One of the most extensive and widely used databases for sound levels from motorized or powered equipment is the FHWA RCNM. While the focus of data compilation was for equipment that would typically be employed for the

construction of transportation facilities, the list is comprehensive enough to be useful in assessing sound levels for nearly every activity for which powered equipment is used. Table 2 provides an excerpt from RCNM of the sound levels generated by various powered equipment that could be associated with construction of the project. Note that the equipment noise levels presented in Table 2 are maximum noise levels. Usually, construction equipment operates in alternating cycles of full power and low power, producing average noise levels over time that are less than the maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment operates and the intensity of construction activities during that time.

Table 2. Selected Powered Equipment Noise Emission Levels from RCNM

Equipment	Maximum Sound Level (dBA L_{max}) – 50 feet from Source
Air Compressor	81
Backhoe	80
Compactor	82
Concrete Mixer	85
Crane, Mobile	83
Dozer	85
Generator	81

Scraper	89
Truck	88

Source: FHWA 2006a, 2006b.

Notes: dBA = decibel (A-weighted).

Noise emissions from the construction phase of the Project were estimated based upon default construction scenario information provided by CalEEMod for the type and size of proposed development, and included phasing, equipment mix, and vehicle trips. The construction equipment mixes used for estimating the Project-generated construction noise emissions are included in Attachment B.

A Microsoft Excel–based noise prediction model emulating and using reference data from the FHWA RCNM was used to estimate construction noise levels at the nearest and second-nearest noise-sensitive land uses (i.e., residences), based upon the distance between the closest project construction boundary and these residences. Aggregate noise emission from project construction activities, broken down by sequential phase of construction, was predicted for the worst-case construction activity occurring along the closest construction boundary to the off-site closest residences. Dudek compared predicted construction noise levels to the recommended FTA construction noise exposure standard and to measured ambient noise levels.

4.1 Construction Equipment Inventory

The California Air Resources Board CalEEMod (California Emissions Evaluation Model) was used to identify the construction equipment anticipated for development of the Project, including earthwork, building construction, and paving activities. The equipment list is based upon the Project description, with construction area of approximately 2 acres, CalEEMod (Version: CalEEMod.2016.3.1) identified the following anticipated equipment for each phase of the Project construction.

Table 3. Construction Equipment Per Phase

Construction Activity	Demolition		
Equipment Needed	Dozer	Backhoe	Concrete Saw
Construction Activity	**Site Preparation**		
Equipment Needed	Dozer	Backhoe	Grader
Construction Activity	**Grading**

Construction Activity	**Building Construction**		
Equipment Needed	Forklift Backhoe	Crane Generator	Welder
Construction Activity	**Paving**		
Equipment Needed	Paver Roller	Dump Truck Concrete Mixer Truck	Backhoe
Construction Activity	**Architectural Coating**		
Equipment Needed	Air Compressor		

4.2 Construction Noise Assessment

With the noise sources identified above, a noise analysis was performed with a Microsoft Excel–based noise prediction model emulating and using reference data from the FHWA RCNM. Input variables consist of the receiver / land use types, the equipment type (i.e., backhoe, crane, truck, etc.), the number of equipment pieces, the duty cycle for each piece of equipment (i.e., percentage of each hour the equipment typically works), and the distance from the sensitive noise. Refer to Attachment A for the inputs used in the RCNM-based model, as well as results.

Noise-sensitive land uses in the vicinity of the Project include residences on properties to the north, northeast, and east of the Project site. The closest off-site residence is located approximately 200 feet from the closest boundary of the proposed Project site; the second closest residence is located approximately 375 feet to the north. Therefore, the construction noise assessment is focused on noise levels that would occur at the distance of the closest off-site residences (i.e., at 200 feet and 375 feet), construction noise levels at greater distances from the site would be less. Using the provided construction information and the distance identified for the closest receivers, the RCNM-based construction noise model was used to predict noise from on-site construction activities. The results are summarized in Table 4 (see Attachment B for complete results).

Table 4. Construction Noise Levels Per Phase at Closest Residences

Task/Activity	Nearest Residence (200 Feet)		Second Nearest Residence (365 Feet)	
	L_{max}	$L_{eq\ 8\text{-}hr}$	L_{max}	$L_{eq\ 8\text{-}hr}$
Demolition	79	73	74	68
Site Preparation	75	71	70	66
Grading	75	72	70	67
Building Construction	74	70	69	65
Architectural Coating	66	62	61	57
Paving	73	69	29	63
Highest Noise Level All Phases	**79**	**73**	**74**	**68**

Manteca Municipal Code, Section 17.58.50.D prohibits construction that creates a noise disturbance across a residential property line, daily between the hours of 7:00 p.m. and 7:00 a.m. Given that construction noise levels at the closest residence would be up to 9 dBA greater than measured daytime noise levels at the closest residence, construction at night would be anticipated to result in a noise disturbance at this and other vicinity residences. The project would therefore be required to adhere to a daily construction schedule limited to the hours between 7 a.m. and 7 p.m., in accordance with MMC Section 17.58.50.D.

With respect to the FTA recommended daytime 8-hour average of 80 dBA at vicinity residences, construction noise levels are predicted to be no greater than an 8-hour average of 79 dBA L_{eq} at the closest residence to the project and would therefore not exceed the FTA recommended limit. Consequently, construction noise impacts of the Project would be less than significant.

In reviewing the results in Table 4, the average construction noise levels at the closest residence (north of the proposed Project site) would range from 62 to 73 dBA L_{eq}. These noise levels are considered to be a peak exposure, applicable not more than 10-15% of the total construction period, only while the construction activity is taking place along the northerly construction site boundary (i.e., closest to the nearest off-site receiver). With average construction noise levels during grading and other typical construction activities ranging up to 73 dBA L_{eq} at the closest residence, even the closest residence would experience a temporary construction noise increase not exceeding 3 dBA L_{eq} over ambient (refer to Table 1). With respect to maximum construction noise levels (L_{max}), demolition activities could produce a maximum noise level of 79 dBA at the closest residence, which would represent a temporary increase of 9 dBA over the ambient noise levels. This maximum noise level would be expected to occur not more than 10-15% of the demolition phase, when activity is occurring along the northern Project site boundary. With typical outdoor to indoor attenuation of 25 dBA for standard construction residential structures, interior noise levels at the closest residence during construction would peak at approximately 54 dBA, which should not interfere with conversation or other daytime activities indoors. Therefore, construction noise levels as compared to daytime ambient levels would result in a less than significant temporary noise impact.

4.3 Conclusions – Construction Noise Levels

Although the adjacent residences could be exposed to construction noise levels that are noticeable compared to ambient levels, and therefore could result in potential annoyance, the exposure would be short term, would occur

during the less sensitive daytime period, and would cease upon proposed Project construction completion. In addition, the noise level increase would also remain below the 10 dBA threshold of significance. Therefore, construction noise would remain less than significant, and would not be anticipated to result in a nuisance.

5 Operational Noise Prediction

5.1 Methodology

Prediction of operation noise attributed to the Project involved creation of a sound propagation model using a Dudek proprietary Excel-based software tool. Dudek NoisePro is used for calculation, presentation, assessment, and prediction of environmental noise. Estimated sound emission from the carwash blower, one self-serve vehicle vacuum, and two HVAC package units (one per commercial space) were entered into the Dudek NoisePro model. The outdoor noise propagation formulas in NoisePro follow the International Organization of Standardization (ISO) Standard 9613-2, "Attenuation of Sound During Propagation Outdoors, Part 2: General Method of Calculation" (ISO 1996).

As discussed in Section 3 (Project Description), the blow dryer at the exit of the carwash tunnel generates the highest noise level of all the equipment included in the carwash. The blow dryer most employed in automated carwashes is manufactured by Sonny's Enterprises. The sound rating for this blow dryer is 90 dBA at a distance of 10 feet. Dudek performed field verification sound pressure measurements of the blow dryer units at Mister Carwash on Airport Way during the completion of ambient noise measurements. A measured sound level of 82 dBA L_{eq} at 25 feet from the car wash exit confirms the manufacturer sound rating is accurate. The most common car vacuum employed at commercial carwash facilities is manufactured by JE Adams. The sound rating for this vacuum is 62 dBA at 50 feet. A representative HVAC package unit for commercial use is the Samsung Model AM036NXMDCR (3-ton capacity); the sound power rating for this equipment is 66 dBA. Refer to Attachment B for specifications for each of this equipment that identifies the manufacturer sound rating.

None of the above-described equipment would be anticipated to operate continuously, but rather would have cycles of operation separated by periods of no operation. In practice, at any given time, some of the equipment would be in operation mode, while other equipment would be in rest mode. Nonetheless, the model was constructed to address a worst-case scenario where all the equipment is in continuous operation.

Calculation parameters that establish how the NoisePro model predicts combined noise level from these above-listed Project sources include as follows:

- Sound propagation per International Organization of Standardization (ISO) 9613-2 (ISO 1996);
- Default ground acoustical absorption coefficient = 0.5 (on a scale of 0 = reflective, 1 = absorptive); and.
- Zero order of reflection.

5.2 Results

Figure 4 depicts the modeled receiver locations for the closest adjacent land uses (R1, R2. R3, R4 and R5) in the NoisePro model space. The receiver points in the NoisePro space are intended to represent Project operational sound levels at these existing nearby residences and commercial properties, for comparison to MMC Section 17.58.50 limits. Table 5 presents the modeled operational noise level at the five receivers and compares these to the MMC Section 17.58.50 limits.

Table 5: Modeled Project Operational Sound Levels Compared to Ordinance Limits

Model Receiver	Modeled Project Operational Noise Level dBA (L_{max})	Noise Ordinance Limit dBA ($L_{eq\ hour}$) [1]
R1	43	50
R2	37	
R3	50	
R4	38	55
R5	40	

Table Notes: [1] Ordinance limit based upon the more restrictive nighttime period, to account for potential Project operations at night.

The noise model results are also graphically represented on Figure 4, which provides noise contours extending outward from the proposed Project to illustrate the maximum (L_{max}) noise level from operation of the Project (i.e., the worst-case scenario with all the equipment in operation simultaneously).

Table 6 compares the modeled Project operational noise levels at the five receivers to ambient noise levels at these receivers. Ambient noise levels are based upon the traffic noise modeling of existing average daily trips along roadways adjacent to the receiver locations (discussed in greater detail in Section 5 of this report).

Table Notes: [1] Ambient noise level based upon nighttime hourly average from modeling of traffic noise for existing traffic trips on roadway adjacent to receiver location (Refer to Attachment D)

5.3 Conclusions – Operational Noise Levels

This noise study includes an analysis of noise emission from simultaneous operation of the total suite of equipment at the facility. As described in Section 5.2, Dudek modelled operation noise levels at each studied receiver from a worst-case scenario with all equipment continuously operating simultaneously which would not be anticipated to occur under actual operational conditions, but which provides an extremely conservative assessment (i.e., the identified resulting sound levels overestimate what would be likely to occur under representative operating parameters). In addition, the NoisePro software enables a user to graphically present the predicted sound pressure levels over a defined horizontal plane, such as illustrated in Figure 4. The legend in the upper left corner of Figure 4 defines a 5-dB range of comparable sound levels for each depicted color. The superposition of the aggregate Project predicted noise emission over the Project site and its surroundings provides the reader a visual understanding of how loud the Project may be at a geographic location (in addition to the selected 5 modeled receivers) from Project operations.

As illustrated in Table 5, in each case, the predicted operational noise level would fall below the applicable nighttime maximum allowable noise limit. As such, the noise from the proposed Project operations would comply with MMC Section 17.58.50. As illustrated in Table 6, in each case project operational noise would be well below the ambient noise level at each of the modeled receivers. Adding the Project operational noise level to the ambient noise level at each receiver would result in less than a 1 dBA increase, which would be well below a noticeable change.

5.4 Recommendations – Operational Noise Levels

Modeling of facility equipment operations noise levels on the basis of simultaneous continuous operation of all equipment, concludes that the facility noise levels would fall below the exterior noise exposure limits applicable to existing nearby residential and commercial properties. Therefore, the Project as proposed and acoustically studied herein would be expected to achieve compliance with the requirements of the MMC Section 17.58.50 limits, no noise control features, or methods would be required or recommended. Project operations would also not result in an increase over ambient noise levels at the existing nearby residential and commercial uses.

6 Offsite Traffic Noise Prediction

6.1 Methodology

Fehr & Peers quantified average daily trips (ADTs) on roadways to which the project would contribute trips, including scenarios for existing, existing plus project, cumulative developments, and cumulative developments plus project traffic (Traffic Generation Assessment for the Daniels Center Manteca Project, Fehr & Peers, October 10, 2022). Roadway segments addressed in the Fehr & Peers study included Daniels Street (east of Airport Way), Airport Way (north of Daniel Street) and Wawona Street (east of Airport Way).

Dudek used a Microsoft Excel based model incorporating standard traffic noise assessment equations adapted from the FHWA noise prediction model to quantify traffic noise exposure levels along roadways to which the Project would contribute trips. Traffic noise levels were modeled based upon the calculated ADT for each included roadway segment and for each of the scenarios addressed in the Fehr & Peers study.

6.2 Results

Based upon ADT data provided by Fehr & Peers, Dudek modelled traffic noise exposure along Daniels Street, Airport Way, and Wawona Street, the roadways to which the Project would principally add trips. The four studied traffic scenarios allow the direct determination of project-related traffic noise increases, by comparing "existing" to "existing plus project" and by comparing "cumulative developments" to "cumulative developments plus project". Table 7 presents the results of the traffic noise modeling, detailed information is provided in Attachment D.

Table 7. Traffic Noise Level Modeling Results

Roadway	Existing dBA CNEL	Existing + Project dBA CNEL	Cumulative Developments dBA CNEL	Cumulative Developments + Project dBA CNEL	Largest Project-Related Increase dBA CNEL	Significant?
Daniels Street	68.4	68.4	68.8	68.8	0	No
Airport Way	71.3	71.6	74.3	74.5	0.3	No
Wawona Street	69.3	69.3	71.2	71.3	0.1	No

Source: Attachment D

6.3 Conclusions – Project Traffic Noise Level Increases

As indicated in Table 7, operation of the Project would involve trip generation that would result in traffic noise level increases on each roadway segment of no more than 0.3 dBA CNEL, which would not be discernible to the human ear. It should be noted that the modeled traffic noise level corresponds to the location of the short-term noise measurement for each roadway, that was used to calibrate the traffic noise model. The ambient sound level measurements varied in distance from approximately 30 to 45 feet from the centerline of the adjacent roadway, while residences appear to be setback by at least 70 feet from the roadway centerline. Given that roadway noise attenuates at a rate of 3 dBA for each doubling of distance, the traffic noise level exposure at the front façade of residences along the above roadways would in most cases be approximately 3 dBA CNEL lower than the values reported in Table 7. According to the traffic modeling results, some residences along Daniels Street. Airport Way, and Wawona Street may be exposed to exterior noise levels that exceed the Noise Element recommended maximum of 60 dBA CNEL. However, the project would increase traffic noise exposure by no more than 0.3 dBA, which is a less than discernible increase. The project would therefore not have a considerable contribution to traffic noise levels that could already exceed recommended levels at vicinity residences.

6.4 Recommendations – Project Traffic Noise

Modeling of Project-related traffic noise level increases along roadways to which the Project would principally add trips concludes that Project-induced increases would in all cases be no greater than 0.3 dBA CNEL. Since the human ear cannot detect changes in noise levels less than 1 dBA CNEL, traffic noise level increases associated with Project trips would not be discernible to residents. No recommendations are required relating to Project traffic noise increases.

7 Construction Vibration

7.1 Methodology

Construction activity can result in varying degrees of ground vibration at local receptors, depending on the equipment and methods used, distance to the affected structures, and soil type. Ground-borne vibration levels resulting from typical construction activities occurring within the Project site were estimated by data and methods published by Caltrans (2020). Ground vibration levels associated with various types of construction equipment are summarized in Table 8 (Caltrans 2020).

Table 8: Vibration Source Levels for Construction Equipment

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Loaded Trucks	0.076
Large bulldozer	0.089
Vibratory roller	0.21

Source: Caltrans 2020

Groundborne vibration attenuates rapidly, even over short distances. The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions found in Caltrans guidance (Caltrans 2020). The following equation is used to calculate Peak Particle Velocity (PPV) at any distance of interest from the operating construction equipment

$$PPV_{rcvr} = PPV_{ref} * (25/D)^{1.5}$$

In the above equation, PPV_{rcvr} is the predicted vibration velocity at the receiver position, PPV_{ref} is the reference value at 25 feet from the vibration source (as listed in Table 8), and D is the actual horizontal distance to the receiver.

7.2 Results

Using the vibration source level of construction equipment provided in Table 8, the distance to the closest sensitive receiver (i.e., residence), and the equation supplied in the Caltrans (2020) construction vibration assessment methodology (above), Dudek estimated the Project construction-related vibration impacts at the closest residence. The closest residence is at a distance of approximately 200 feet north from the Project site property line and future construction zone boundary. Table 9 presents the results of the construction vibration assessment for the closest residence.

Table 9: Construction Vibration Levels at Closest Residence

Equipment	PPV (in/sec) at Nearest Residence (200 Feet)	Significance Threhold PPV (in/sec)	Significant ?
Small bulldozer	0.0001	0.24	**No**
Loaded Trucks	0.0033		**No**
Large bulldozer	0.0039		**No**
Vibratory roller	0.0093		**No**

7.3 Conclusions – Construction Vibration

As illustrated in Table 9, Project construction-related vibration levels at the residence closest to the Project would in all cases represent less than 10% of the significance threshold for human annoyance (0.24 PPV in/sec). The threshold for structural damage to typical residential structures is even higher (0.5 PPV in/sec). As such, Project construction would have no potential to cause structural damage to the closest residences, or to result in annoyance for the occupants of such residences.

7.4 Recommendations – Construction Vibration

Modeling of Project-related construction vibration at the closest residence to the Project site concluded no potential for human annoyance or structural damage. No construction vibration controls are required or recommended relating to the Project.

NOISEPRO MODELING DATA

Technical Basis of Dudek's "NoisePro" Excel-based Outdoor Sound Propagation Prediction Model

In summary, the Microsoft Excel-based **NoisePro** outdoor sound propagation model developed by Dudek calculates the aggregate sound pressure level (SPL) received by each and every cell within a two-dimensional (2D) array (a product of X columns of cells by Y rows of cells). The quantity of this received SPL, in A-weighted decibels (dBA), is the logarithmic sum of acoustical contribution from each of "n" user-input sound emitting point sources located on the same 2D array, which may be written as follows:

$$SPL_{X,Y} = 10 * \log \sum_{i=1}^{n} 10^{0.1[L_i - A_i]}$$

where each individual source sound level (L_i) is attenuated by an algebraic sum of three attenuation factors ($A_i = A_{div} + A_{atm} + A_{gr}$) that are each dependent on the distance between the sound source position on the X by Y array and the receiving $SPL_{X,Y}$ position on a different position in the same 2D array of worksheet cells, where each cell is defined by the user as representing the center of a square area having equal sides of user-defined length in feet. The above expression is based on Equation 5 from the International Organization for Standardization (ISO) 9613-2 "Acoustics – Attenuation of sound during propagation outdoors – Part 2: General method of calculation", and the individual attenuation factors used by **NoisePro** emulate those in Equation 4 and may be summarized as follows:

- $\boldsymbol{A_{div}}$ = attenuation due to *geometrical divergence* (i.e., pure distance), equating to 20*LOG(d/d_{ref}); and where $\boldsymbol{d}$ is the horizontal distance between a source and a receiver position, while $\boldsymbol{d_{ref}}$ is the reference distance at which the sound source L_i is defined.
- $\boldsymbol{A_{atm}}$ = attenuation due to *atmospheric absorption*, which for 1,000 Hz (1 kHz) = 4.16*$\boldsymbol{d}$/3280 and is derived from Equation 5.7 in Noise & Vibration Control Engineering (Beranek and Ver, 1992).
- $\boldsymbol{A_{gr}}$ = attenuation due to *ground effects*, appearing as Equation 10 in ISO 9613-2 and can be expressed with the following Excel formula:

  $$\boldsymbol{A_{gr}} = \text{MAX}(0,4.8-[\boldsymbol{h_s}+\boldsymbol{h_r}]/\boldsymbol{d}*[17+984/\boldsymbol{d}])$$

  where $\boldsymbol{h_s}$ and $\boldsymbol{h_r}$ are the heights (in feet) of the sound source and receiver positions above grade, respectively. This means that for small distances, attenuation from ground effects will be small or essentially zero; and, even at great distances, the attenuation from ground effects is effectively capped at 4.8 dB.

The Excel workbook comprising **NoisePro** calculates $SPL_{X,Y}$ by using a coding loop to evaluate the acoustic contribution from each attenuated sound source ($\boldsymbol{L_i}$ - $\boldsymbol{A_i}$) in sequence, and logarithmically adding the new evaluation to the previous total in a cumulative manner. When all sources have been evaluated, the loop terminates and yields an aggregate or log-summed total $SPL_{X,Y}$ value that is thus unique to a position in the 2D array of cells represented by X and Y, and can thus be "mapped". If the user has defined a particular cell in the X by Y array as a uniquely tagged Receiver, then the corresponding $SPL_{X,Y}$ value can be indexed and displayed accordingly.

The resulting output array of cells, each having an individually calculated $SPL_{X,Y}$ numerical value, is then filled with a color (from a user-defined palette) by application of a Conditional Formatting rules set (an Excel formatting feature) that compares the dB quantity with user-defined "high" and "low" dB ranges for each available color. Each colored cell can thus be likened to a "pixel" within a 2D array that forms a composite image representing—visually—the sound propagation from all modeled sound sources.

Source Inventory with Model Grid Coordinate Locations and Sound Pressure Reference Levels

grid scale	ft	Noise Source Description	Type	SPL (dBA)	Ref. Distance (feet)

7. Sound Data

Summary

Capacity		Model	Sound Pressure dB (A)		Sound Power dB(A)
Ton	Btu/h		Cooling	Heating	
3	38,000	AM036NXMDCR/AA	50	52	66
4	48,000	AM048NXMDCR/AA	51	53	68
4.5	53,000	AM053NXMDCR/AA	53	55	69
5	60,000	AM060NXMDCR/AA	58	60	76

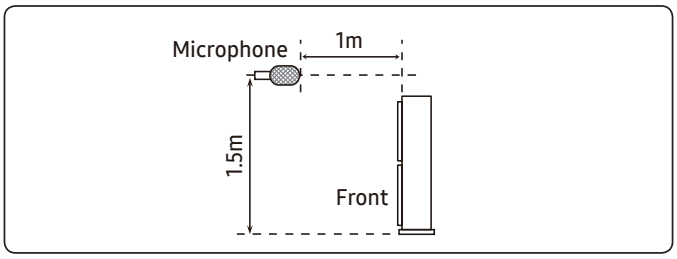
NOTE

- Specifications may be subject to change without prior notice.
- Sound Pressure Level
  - Sound pressure level is obtained in an anechoic room.
  - Sound pressure level is a relative value, depending on the distance and acoustic environment.
  - Sound pressure level may differ depending on operation condition.
  - dBA = A-weighted sound pressure level
  - Reference acoustic pressure 0 dB = 20μPa
- Sound Power Level
  - Sound power level is an absolute value that a sound source generates.
  - dBA = A-weighted sound power level.
  - Reference power : 1pW.
  - Measured according to ISO 3741.

7. Sound Data

Sound Pressure level

Unit: dB(A)



Model	Cooling	Silent 1	Silent 2	Silent 3
AM036NXMDCR/AA	50	47	44	41

Table of Contents

1. Introduction 1

1.1 Project Description 1

1.2 Study Area 4

Study Intersections 4

Study Driveways 4

1.3 Study Scenarios 4

2. Existing Conditions 5

2.1 Existing Pedestrian and Bicycle Facilities 5

2.2 Existing Transit Facilities 5

2.3 Data Collection 9

2.4 Existing Intersection Operations 9

3. Policy Consistency 13

3.1 Manteca General Plan 13

Land Use & Zoning 13

Circulation 13

3.2 Manteca Active Transportation Plan 15

4. Vehicle Miles Traveled Screening Analysis 17

4.1 Applicable Policies and Guidelines 17

Senate Bill 743 17

Applicable Policies for Evaluating Transportation Impacts in CEQA 17

4.2 Project VMT Screening 17

5. Intersection Operations Analysis Methodology 19

5.1 Level of Service 19

5.2 Traffic Volume Forecasting 21

Baseline (2019) Traffic Forecasting Model 21

Interim Year (2040) Scenario Traffic Forecasting Model 21

Limitation 21

6. Existing Plus Project Conditions 23

6.1 Project Trip Generation 23

1. Introduction

This study addresses the potential transportation impacts associated with the proposed Daniels Center project located in the City of Manteca. Project impacts to intersection operations and bicycle, pedestrian and transit facilities are analyzed under both existing and future conditions. Screening analysis is performed to determine if the project qualifies to be relieved of performing a complete vehicle miles traveled (VMT) impact analysis. This report documents the methodologies, inputs, and results of the analysis.

1.1 Project Description

The project site encompasses 1.75 acres located in the western portion of the City of Manteca, in the northwest quadrant of the Airport Way and Daniels Center intersection. The project site is located at 2125 Daniels Street, Manteca, CA 95337. The project site is bounded by Airport Way to the east and Daniels Street to the south, and undeveloped properties to the west and north. **Figure 1** shows the location of the project site.

The proposed project site plan (*Daniels Center*, K12 Architects, June 14, 2021) includes the following commercial uses:

- A 2,300 square foot fast-food restaurant with drive-through lane
- A gas station with 20 fueling positions and car wash
- A 3,400 square foot convenience store

The project parcel has a General Commercial land use designation. **Figure 2** displays the project site plan. The site plan shows a total of 39 parking spaces would be provided.

According to the site plan and discussions with the project architect, K12 Architects, access to the project site would be provided by two right-in/right-out access driveways: one on Airport Way, and one on Daniels Street. Both project driveways would be side-street stop controlled. Pedestrian access to the project site is accessible via sidewalks on Airport Way and Daniels Street.

Figure 2

Site Plan

1.2 Study Area

The study area was selected based on the project's location, site access, and expected trip distribution of trips. The analysis considers traffic operations at the following intersections and driveways, which are displayed on Figure 1.

Study Intersections

1. Airport Way/Wawona Street
2. Airport Way/Daniels Street
3. Airport Way/SR 120 Westbound Ramps
4. Airport Way/ SR 120 Eastbound Ramps
5. Daniels Street/Milo Candini Drive
6. Daniels Street/Driveway between Starbucks & dd's Discounts Clothing Store (Refer as Starbucks Driveway in the report)

Study Driveways

7. Driveway #1/Airport Way
8. Driveway #2/Daniels Street

1.3 Study Scenarios

The study intersections were evaluated for the following four scenarios:

- **Existing Conditions** – Analyzes operations as they exist today.
- **Existing Plus Project Conditions** – Analyzes existing operations with the addition of trips generated by the project.
- **Cumulative No Project Conditions** - Analyzes cumulative conditions assuming the project site remains in its current undeveloped state.
- **Cumulative Plus Project Conditions** – Analyzes cumulative conditions with the addition of trips generated by the project.

2. Existing Conditions

This chapter presents the existing pedestrian, bicycle, and transit facilities and intersection operations under Existing Conditions.

2.1 Existing Pedestrian and Bicycle Facilities

Figure 3 presents the existing pedestrian network in the study area. As displayed, sidewalks are present along the project frontage on Airport Way and Daniels Street. North of the project site along the west side of Airport Way, sidewalks are not present.

All legs of the signalized Airport Way/Daniels Center intersection have crosswalks with push-button activation. All crosswalk legs feature curb ramps and connect to sidewalks. The northwest corner of the intersection has a sidewalk ends sign heading north on Airport Way.

Figure 4 presents the existing bicycle network in the study area. There are currently no bike facilities along the project frontage on Airport Way or Daniels Street. There are bike lanes on Milo Candini Drive and on Daniels Street east of Airport Way.

2.2 Existing Transit Facilities

Figure 5 presents the existing transit network in the study area. Manteca Transit operates a fixed-route and Dial-a-Ride bus service with stops throughout the City. The nearest bus stops are:

- Stadium Center @ Daniels Street (Stop 8): approximately a ¼ mile walk westerly along Daniels Street from the southern project driveway. This stop serves Routes 1 and 2.
- Daniels Street @ Fishback Road: approximately a 0.16 mile walk easterly along Daniels Street from the southern project driveway. This stop serves Routes 1 and 2.
- Airport Way @ Daniels Street (Stop 33): across the street from the project on northbound Airport Way. This stop serves Route 4.

Manteca Transit Routes 1 and 2 provide weekday and Saturday fixed route service, while Route 4 provides weekday service only.[1] Route 1 follows a primarily central east-west path on Yosemite Avenue and Airport Way, serving multiple schools and shopping centers. Route 2 serves Manteca residents in south of Yosemite Avenue, with stops along Main Street, Woodward Avenue, and Daniels Street. Route 4 serves west of Main Street, with stops along Main Street, Woodward Avenue, Airport Way, and Northgate Drive.

2.3 Data Collection

Traffic count data along Airport Way (Intersections #1-4) was collected in Spring 2022. Count data along Daniels Street (Intersections #5-6) was collected in Fall 2022. The traffic counts were collected after the Great Wolf Lodge Water Park (south of Daniels Street, west of the Stadium Center Retail Plaza) was opened in 2021.Both data sets were collected when nearby schools were in session and weather conditions were dry during the AM (7:00 to 9:00) and PM (4:00 to 6:00) peak periods. Existing lane configurations were obtained via aerial imagery from Google Maps and confirmed based on field observations.

Several field observations were conducted for the project to understand the intersection operations under existing condition, the drive-through and queueing conditions for a fast-food restaurant with drive-through and a car wash attached to a gas station. The field observations were performed in September and October 2022, and the details of the field observations are documented in Chapter 2.4, and Chapter 8.3.

2.4 Existing Intersection Operations

Field observations were performed on September 28, 2022 during the PM peak period. Field observations revealed significant queuing at Intersection 2 (Airport Way/Daniels Street) for northbound left and eastbound right movements. Delays are considerable due to a number of factors present at the intersection including:

- Long cycle lengths (120 to 150 seconds) are typical during PM peak hour.
- There is a significant amount of eastbound right-turn trips originating from the Stadium Center Retail Plaza located in the southwest corner of Airport Way/Daniels Street. These trips, along with trips generated by other uses along Daniels Street, result in a heavy eastbound right-turn demand (510 vehicles during PM peak hour). To accommodate this heavy movement in a single turn lane, an overlap phase is provided allowing the eastbound right-turn movement to operate simultaneously with the northbound left-turn. This, in turn, contributes to consistent occupancy of the southbound through receiving lanes approaching the SR 120 WB ramps intersection. This

condition contributes to increased queuing and delays to the westbound left movement at intersection 2.

- There is a significant amount of northbound left turn trips and the queue spills back to Intersection 3 (Airport Way/Westbound SR 120 Ramps) which affects the westbound right-turn and northbound through movement at Intersection 3.

Photo of northbound left turn queueing spills back to Intersection 3

Figure 6 displays AM and PM peak hour turning movements and lane configurations at the study intersections under Existing conditions. **Table 1** displays the existing AM and PM peak hour operations at the study intersections. Study intersections were analyzed using procedures and methodologies contained in the *Highway Capacity Manual 7th Edition* (Transportation Research Board, 2022). These methodologies were applied using the SimTraffic microsimulation model to analyze traffic operating conditions at the study intersections. The observed maximum vehicle queues at study intersections are used to calibrate the SimTraffic network under existing conditions. Based on the counts, the AM peak hour occurred from 8:00 to 9:00 and the PM peak hour occurred from 4:00 to 5:00. The AM peak hour factor (PHF) ranged from 0.77 (Intersection 1 Airport Way/Wawona St) to 0.87 (Intersection 3,4,5), with an approximate average of 0.83[2]. The PM PHF was very similar at all study intersections with an average of 0.95. SimTraffic models must utilize a single PHF, and the average of AM and PM PHF was used in the study. Through iterative testing, the simulation results reflect the observed existing conditions.

[2] The PHF measures the degree of peaking within the peak hour. A PHF of 1.0 represents uniform flow across all four 15-minute periods, while a PHF of 0.25 indicates all travel occurred during a single 15-minute window. The PHF is an input into the traffic operations model described later.

Level of service (LOS) is a qualitative measure of traffic operating conditions whereby a letter grade, from A to F is assigned. The detailed explanation of intersection operation analysis methodology is documented in Chapter 5, which explains Level of Service (LOS) and the threshold. Policy C-P-2 of the 2023 City of Manteca General Plan strives for LOS D or better. As shown in **Table 1** all study intersections currently operate acceptably in AM and PM peak hour. Existing intersection turning movements at study intersections and technical calculations are in **Appendix A**.

Table 1: Intersection Operations – Existing Conditions

Intersection	Control Type	AM Peak Hour		PM Peak Hour	
		Delay[1]	LOS	Delay[1]	LOS
1. Airport Way/Wawona Street	SSSC	4 (12)	A (B)	7 (33)	A (D)
2. Airport Way/Daniels Street	Signal	26	C	39	D
3. Airport Way/Westbound SR 120 Ramps	Signal	17	B	24	C
4. Airport Way/Eastbound SR 120 Ramps	Signal	30	C	26	C
5. Daniels Street/Milo Candini Drive	Signal	3	A	9	A
6. Daniels Street/Starbucks Driveway	SSSC	3 (6)	A (A)	5 (13)	A (B)

Notes:
SSSC = Side-Street Stop Control; LOS = Level of Service.
Bold indicates deficient operations.
[1] For signalized intersections, average intersection delay is reported in seconds per vehicle for all approaches. For side street stop-controlled intersections, intersection delay is reported in seconds per vehicle for the overall intersection and (worst-case) movement. Intersection delay is calculated based on the procedures and methodology contained in the *Highway Capacity Manual 7th Edition* (Transportation Research Board, 2022).

Peak Hour Traffic Volumes and Lane Configurations - Existing Conditions

3. Policy Consistency

The *City of Manteca Active Transportation Plan* (2020) and 2023 *City of Manteca General Plan* were reviewed to determine if the proposed project results in any inconsistencies with adopted transportation-related policies.

3.1 Manteca General Plan

Land Use & Zoning

The currently adopted 2023 City of Manteca General Plan designates the project site as General Commercial. The City is currently conducting a General Plan update, which also designates the project site as commercial. Therefore, the proposed project is consistent with both the existing and the proposed General Plan land use designations.

Circulation

The following relevant Circulation Policies from the Circulation Element of the currently adopted 2023 City of Manteca General Plan were evaluated for consistency with the proposed project.

Level of Service

Relevant Policies:

C-P-1: The City shall strive to balance levels of service (LOS) for all modes (vehicle, transit, bicycle, and pedestrian) to maintain a high level of access and mobility, while developing a complete and efficient circulation system. The impact of new development and land use proposals on LOS and accessibility for all modes should be considered in the review process.

C-P-2: To the extent feasible, the City shall strive for a vehicular LOS of D or better at all streets and intersections, except in the Downtown area where right-of-way is limited, pedestrian, bicycle, and transit mobility are most important and vehicular LOS is not a consideration.

Evaluation: Vehicle intersection operations were analyzed for the proposed project in Chapters 6 and 7 and accommodations for bicyclists and pedestrians are discussed in Chapter 8. With the improvements identified in the City of Manteca Public Facilities Implementation Plan (PFIP), most study intersections would still operate deficiently during the PM peak hour under cumulative conditions.

Major Streets Master Plan

Relevant Policies:

C-P-4: Streets shall be dedicated, widened, extended, and constructed according to street cross-section diagrams established in the City Standard Plans.

C-P-5: Major circulation improvements shall be completed as abutting lands develop or redevelop, with dedication of right-of-way and construction of improvements, or participation in construction of such improvements, required as a condition of approval.

C-P-6: New development shall pay a fair share of the costs of street and other transportation improvements based on impacts to LOS and other modes in conformance with the goals and policies established in this Circulation Element and the PFF program.

C-P-8: Street improvements will be designed to provide multiple, direct and convenient routes for all modes.

Evaluation: The proposed project site plan and recommendations in the study are consistent with Policies C-P-4, C-P-5, C-P-6, and C-P-8. As required in the conditions of approval in this report. the project developer would dedicate of right-of-way and/or construct roadway improvements as part of project construction and pay fair share of costs based on project transportation impacts.

Transportation Safety

Relevant Policies:

C-P-20: The creation or continuance of traffic, bicycle, and pedestrian hazards shall be discouraged in new development, infill development, and redevelopment areas.

C-P-21: In the development of new projects, the City shall give special attention to maintaining/ensuring adequate corner-sight distances appropriate for the speed and type of facility, including intersections of city streets and private access drives and roadways.

C-P-22: The City shall encourage the development of landscape separated sidewalks along roadways (particularly arterials and non-residential streets) when feasible to discourage pedestrian/vehicle conflicts and be consistent with complete streets concepts.

Evaluation: The project would be consistent with C-P-20 and C-P-21. The project would not create any vehicle, bicycle, or pedestrian hazards. The project would maintain adequate corner sight distance at the Airport Way/Daniels Street intersection in accordance with the Manteca Municipal Code section 17.54.060. Sidewalks on the project frontage are already built. Daniels Street frontage has a landscape buffer between the sidewalk and roadway, but Airport Way frontage sidewalk does not.

Parking

Relevant Policies:

C-P-24: New development shall provide an adequate number of off-street parking spaces to accommodate the typical parking demands of the type of development on the site. The City may dictate both minimum and maximum amounts of parking; the use of shared parking is encouraged to reduce overall land consumed by parking areas.

C-P-27: Ensure that there is adequate parking for normal commercial activities.

Evaluation: The project site plan shows 39 parking spaces, which exceeds the parking required by Manteca Municipal Code section 17.52.050 by two spaces. Therefore, an adequate supply of parking would be provided.

Bikeways and Pedestrian Facilities

Relevant Policies:

C-P-30: Provide adequate bicycle parking facilities at commercial, business/professional and light industrial uses.

C-P-32: The City shall strive to provide on-street Class II bike lanes along major collector and arterial streets whenever feasible.

C-P-36: The City shall strive to provide a sidewalk system that serves all members of the community and meets the latest guidelines related to the Americans with Disabilities Act (ADA).

C-P-37: All new sidewalks, walkways, and intersection crosswalks shall be consistent with the requirements of the ADA.

Evaluation: The proposed project is consistent with C-P-30, C-P-36, and C-P-37. The project site plan shows six bicycle parking spaces, exceeding the four that would be required based on Manteca Municipal Code section 17.52.110. For C-P-32, the site plan does not specifically show bike lanes along the project frontage on Airport Way and Daniels Street, though proposed Class II bikeways were identified in Manteca Active Transportation Plan. The City may choose to accommodate these improvements when these roadways are restriped. The project site plan maintains the existing sidewalks and curb ramps on the northwest corner of the Airport Way/Daniels Center intersection and at project driveways.

Goods Movement

Relevant Policies:

C-P-50: All roads identified as truck routes shall be designed to accommodate STAA trucks.

Evaluation: The proposed project could be consistent with C-P-50. As the City works with San Joaquin County and surrounding jurisdictions to finalize its truck routes, it will need to ensure designated routes are designed appropriately, and let developers know of truck route designations and design requirements.

3.2 Manteca Active Transportation Plan

The Manteca Active Transportation Plan (ATP) identifies the following planned improvements near the project site:

- Class II bike lanes on Airport Way between Yosemite Avenue and Daniels Street
- Class II bike lanes on Daniels Street between Airport Way and Milo Candini Drive
- Class II bike lanes on the extension of Wawona Street west of Airport Way
- Class II bike lanes on the extension of Milo Candini Drive between Daniels Street and Yosemite Avenue
- Sidewalk along the west side of Airport Way between Yosemite Avenue and south of SR 120.

Planned improvements of Class II (on-street with appropriate signage and pavement markings) buffered bike lanes are identified on Airport Way between Yosemite Avenue and Daniels Street based on the ATP. However, based on the PFIP, the planned improvements on Airport Way will be Class II bike lanes. The City may choose to accommodate the Class II buffered bike lanes by narrowing the vehicle travel lanes.

Similarly, the City may choose to accommodate the Class II bike lanes on Daniels Street between Airport Way and Milo Candini Drive by narrowing the vehicle travel lanes.

The ATP also provides guidance on short-term and long-term bicycle parking. As defined in the ATP, short-term bicycle parking is temporary bicycle parking intended for visitors, typically provided as bike racks. Long-term bicycle parking is intended for employees to protect bicycles for extended periods and are more secure to protect bicycles from theft and weather. The proposed project shows six bike racks, a form of short-term bicycle parking. Long-term bicycle parking could be provided for employees within each building. The ATP also provides guidance on effective and secure bicycle parking design.

4. Vehicle Miles Traveled Screening Analysis

This chapter describes the screening analysis performed to determine if the project qualifies to be relieved of performing a complete vehicle miles traveled (VMT) impact analysis.

4.1 Applicable Policies and Guidelines

Senate Bill 743

Senate Bill (SB) 743 was signed into law in 2013 and led to the addition of Section 15064.3, Determining the Significance of Transportation Impacts, to the CEQA Guidelines. Per the new section, "Generally, vehicle miles traveled is the most appropriate measure of transportation impacts. For the purposes of this section, 'vehicle miles traveled' refers to the amount and distance of automobile travel attributable to a project."

Applicable Policies for Evaluating Transportation Impacts in CEQA

The City of Manteca is in the process of developing guidelines for transportation impact analysis. For the purpose of this study, methodology and screening criteria in the City's Draft *Transportation Impact Analysis Guidelines* (TIA Guidelines) will be applied.

The TIA Guidelines includes a list of land use projects whose transportation VMT impacts are presumed to be less-than-significant, and therefore may be relieved of performing a complete VMT impact analysis. Consistent with the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (California Office of Planning & Research [OPR], December 2018).[3] the City's *TIA Guidelines* recommend screening out local-serving retail land uses from VMT analysis as explained below.

> **Local-Serving Retail:** Trip lengths may be shortened and VMT reduced by adding "local-serving" retail opportunities that improve destination proximity. The *Technical Advisory* generally describes retail development including stores less than 50,000 square feet as locally serving. Restaurants may also be screened using this criterion.

4.2 Project VMT Screening

As noted above, local-serving retail is one of the uses that can be presumed to have a less-than-significant VMT impact and thus be screened out of VMT analysis. The OPR *Technical Advisory* notes that new retail development typically redistributes shopping trips rather than creating new trips. The proposed gas station, car wash, and fast-food restaurant uses would qualify as retail uses, and would likely have a

[3] http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf

similar effect on travel. Demand for these services is relatively fixed, with customers selecting businesses to patronize based on convenience, quality, and/or offered services. The OPR *Technical Advisory* further states that "adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT. Thus, lead agencies generally may presume such development creates a less-than-significant transportation impact."

The proposed project can reasonably be described as a "local-serving" business that would improve commercial destination proximity. In accordance with the OPR *Technical Advisory*, the project would satisfy the local-serving retail VMT screening criteria by virtue of the nature and size of the project (commercial use with less than 50,000 square feet of building floor area consisting of a local-serving use). Therefore, no quantitative VMT analysis or associated mitigation measures are required for transportation purposes, and the project can be presumed to have a less than significant impact on VMT.

5. Intersection Operations Analysis Methodology

This chapter describes the methods used to analyze the study intersections and to develop cumulative traffic forecasts.

5.1 Level of Service

Study intersections were analyzed using procedures and methodologies contained in the *Highway Capacity Manual 7th Edition* (Transportation Research Board, 2022). These methodologies were applied using the SimTraffic microsimulation model to analyze traffic operating conditions (i.e., delay, level of service, and queuing) at the study intersections. SimTraffic considers the effects of lane utilization, heavy vehicle composition, turn pocket storage lengths, upstream/downstream queue spillbacks, and coordinated signal timings on intersection queuing and delays. Reported results are based on an average of 10 runs.

Level of service (LOS) is a qualitative measure of traffic operating conditions whereby a letter grade, from A to F is assigned. These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with driving. In general, LOS A represents free-flow conditions with no congestion, and LOS F represents severe congestion and delay under stop-and-go conditions. For signalized intersections and all way stop control intersections, LOS is based on the average delay experienced by all vehicles passing through the intersection. For side-street stop-controlled intersections, the delay and LOS for the overall intersection is reported along with the delay for the worst-case movement. **Table 2** displays the delay range associated with each LOS category for signalized and unsignalized intersections.

Table 2: Intersection Level of Service Criteria

LOS	Description (for Signalized Intersections)	Average Delay at Signalized Intersections (seconds/vehicle)	Average Delay at Unsignalized Intersections (seconds/vehicle)
A	Operations with very low delay occurring with favorable traffic signal progression and/or short cycle lengths.	< 10.0	< 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	> 10.0 to 20.0	> 10.0 to 15.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	> 20.0 to 35.0	> 15.0 to 25.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	> 35.0 to 55.0	> 25.0 to 35.0
E	Operations with high delay values indicating poor progression, and long cycle lengths. Individual cycle failures are frequent occurrences. This is considered the limit of acceptable delay.	> 55.0 to 80.0	> 35.0 to 50.0
F	Operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.	> 80.0	> 50.0

Note: LOS = level of service; V/C ratio = volume-to-capacity ratio
Source: Transportation Research Board, 2022

LOS may no longer be used to identify significant transportation impacts in California Environmental Quality Act (CEQA) documents for land use projects. However, this analysis includes a LOS analysis to determine if the proposed project would result in deficient intersection operations per the City of Manteca standards. Policy C-P-2 of the 2023 City of Manteca General Plan strives for LOS D or better as discussed in Chapter 3.

5.2 Traffic Volume Forecasting

Baseline (2019) Traffic Forecasting Model

The Baseline Traffic Forecasting Model (TFM) developed for the Manteca General Plan Update was used to the estimate the project's expected spatial trip distribution under Existing Plus Project conditions.

Interim Year (2040) Scenario Traffic Forecasting Model

The Interim Year 2040 Traffic Forecasting Model (TFM) was developed based on expected future land use and planned transportation network for the City of Manteca and adjacent areas in 2040, which is also referred as Cumulative Year TDFM. The City of Manteca is planning for a large amount of growth for both housing and employment in the General Plan Buildout scenario. The Cumulative Year 2040 model scenario was developed in coordination with both Manteca and Lathrop city staff who provided land use growth projections they anticipate over the next 20 years. The TFM estimates traffic demand volumes based on this land use input. The City of Manteca 2040 land use inputs were developed based on the City of Manteca's approved and anticipated projects that are expected to be constructed and occupied by year 2040. The City of Lathrop 2040 land use inputs were developed based on the City's historic rate of growth in households and employment for the past 5 years (2016 to 2020). The location of the growth in Manteca and Lathrop was allocated across the cities where future growth is anticipated, including the area west of I-5 and south of the SR 120 corridor. Financially constrained transportation network improvements as identified by the Manteca General Plan Update, the City of Manteca Public Facilities Implementation Plan (PFIP), the City of Lathrop Specific Plan (2022), and the San Joaquin Council of Government (SJCOG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Project List are included.

The Cumulative Year 2040 TFM scenarios were updated to reflect the project proposed access to the nearby street system and was used to analysis cumulative traffic conditions for the project. The traffic forecasting adjustment procedure known as the difference method was used to develop Cumulative Year (2040) AM and PM peak hour traffic forecasts. For a given intersection, this forecasting procedure is calculated as follows for every movement:

Cumulative Year Forecast =
Existing Volume + (Cumulative Year TFM Volume – Baseline TFM Volume)

This method corrects any potential anomalies within the base year model that could otherwise be replicated in future year model.

Limitation

The City of Manteca TFM was developed based on travel behavior survey data collected before the COVID-19 pandemic. While the TFM was calibrated to replicate base year traffic conditions, travel behavior and the transportation systems are changing quickly in response to emerging trends and new technologies, such as on-demand ride-hailing (e.g., Uber and Lyft) and micro-transit services, car-sharing, bicycle/scooter-sharing, and automation of vehicles. These changes combined with the current effects of

the COVID-19 pandemic increase uncertainty about how vehicle trip generation rates may change for land use projects over the time.

6. Existing Plus Project Conditions

This chapter presents analysis of the project trip characteristics and the results of intersection operations analysis under Existing Plus Project conditions.

6.1 Project Trip Generation

Because the project site consists of several complimentary uses that could result in internal trip-making, trip generation estimates were prepared using a combination of the *Trip Generation Manual, 11th Edition* (Institute of Transportation Engineers, 2021) and the Mixed-Use Trip Generation Model (MXD+), which was originally developed for the US EPA to estimate internal trip-making and external trips made by non-auto travel modes. The *Trip Generation Manual* was used to estimate the project's gross trips based on each individual land use; then, MXD+ was applied to estimate internal trips between on-site land uses. The internal trips are subtracted from the gross trip generation.

Because land uses such as gas stations and fast-food restaurants attract pass-by trips, pass-by trips are also considered in project trip generation. Pass-by trips represent drivers already travelling on the street adjacent to the project (Airport Way and Daniels Street) that decide to patronize the project site. Therefore, pass-by trips are not generated by the project but are existing vehicles on the roadway facility. The rates were calculated from the *Trip Generation Manual* Appendices (Institute of Transportation Engineers, 2021). AM and PM peak hour pass-by rates for convenience store/gas station and fast-food restaurant with drive-through land use categories in the *Trip Generation Manual* were used for the pass-by estimates.

Table 3 presents the estimated AM and PM peak hour vehicle trips created by the proposed project. The fast-food restaurant was assumed to be a standard/typical user and not ultra-popular brands such as In-N-Out Burger, or Chick-fil-A. Along with internal trips estimated by MXD+, these estimates also consider pass-by trips. While the project would generate substantial numbers of entering/exiting trips, more than 66% of those trips would be pass-by based on the nature of the land uses proposed.

Table 3: Project Trip Generation

Land Use Category (ITE Land Use Code)	Quantity	AM Peak Hour Trips[1]			PM Peak Hour Trips[1]		
		In	Out	Total	In	Out	Total
Convenience Store/Gas Station (945)	20 FPs	160	160	320	184	184	368
Automated Car Wash[2] (948)	1 Tunnel	0	0	0	0	0	0
Fast-Food Restaurant with Drive-through Window (934)	2.3 KSF GLA	52	50	102	40	36	76
Gross Trips		212	210	422	224	220	444
Internal Trips[3]		-9	-9	-18	-13	-12	-25
Pass-by-Trips[4]		140	140	280	151	149	300
New Peak Hour Vehicle Trips		63	61	124	60	59	119

Notes: FPs = fueling positions, KSF = thousand square feet, GLA = gross leasable area

[1] Based on average trip rates in the *Trip Generation Manual, 11th Edition* (ITE, 2021).

[2] The car wash is part of the gas station/convenience market and not a standalone use that would draw its own clientele. To the extent it generates any trips, they are already reflected in the trip generation estimates for the gas station/convenience market category.

[3] Internalization based on output from MXD+: 4.3% in the AM peak hour, and 5.6% in the PM peak hour.

[4] The following pass-by trip percentages (AM/PM) were applied based on data from the *Trip Generation Manual, 11th Edition* (ITE, 2021).

- Convenience Store/Gas Station: 75%/75%
- Fast-Food Restaurant with Drive-through Window: 50%/55%

6.2 Project Trip Distribution

Project trips were distributed throughout the study area based on the location of access roads, existing directional patterns, and output from the Baseline TFM. **Figure 7** presents the existing project trip distribution. As shown, about 60% of new trips are expected to be distributed to/from the south on Airport Way toward SR 120. The remainder are expected to use Airport Way to/from north or Daniel Street. Intersection 6 features two eastbound receiving lanes with about 24 feet of width. This is not sufficient to enable u-turns to occur from the westbound left-turn lane. Accordingly, no project trips were assumed to perform u-turns in this turn lane.

New trips were assigned to the project driveways based on the trip distribution percentages in Figure 6. Pass-by project trips were assigned to driveways in accordance with the level of traffic on the adjacent street and ease of performing the pass-by movement (i.e., ease of turning right into the site versus left). It should be noted that U-turns are prohibited on the northbound and westbound approaches to the Airport Way/Daniels Street intersection. **Figure 8** displays the traffic volumes under Existing Plus Project conditions.

Peak Hour Traffic Volumes and Lane Configurations - Existing Plus Project Conditions

6.3 Existing Plus Project Intersection Operations

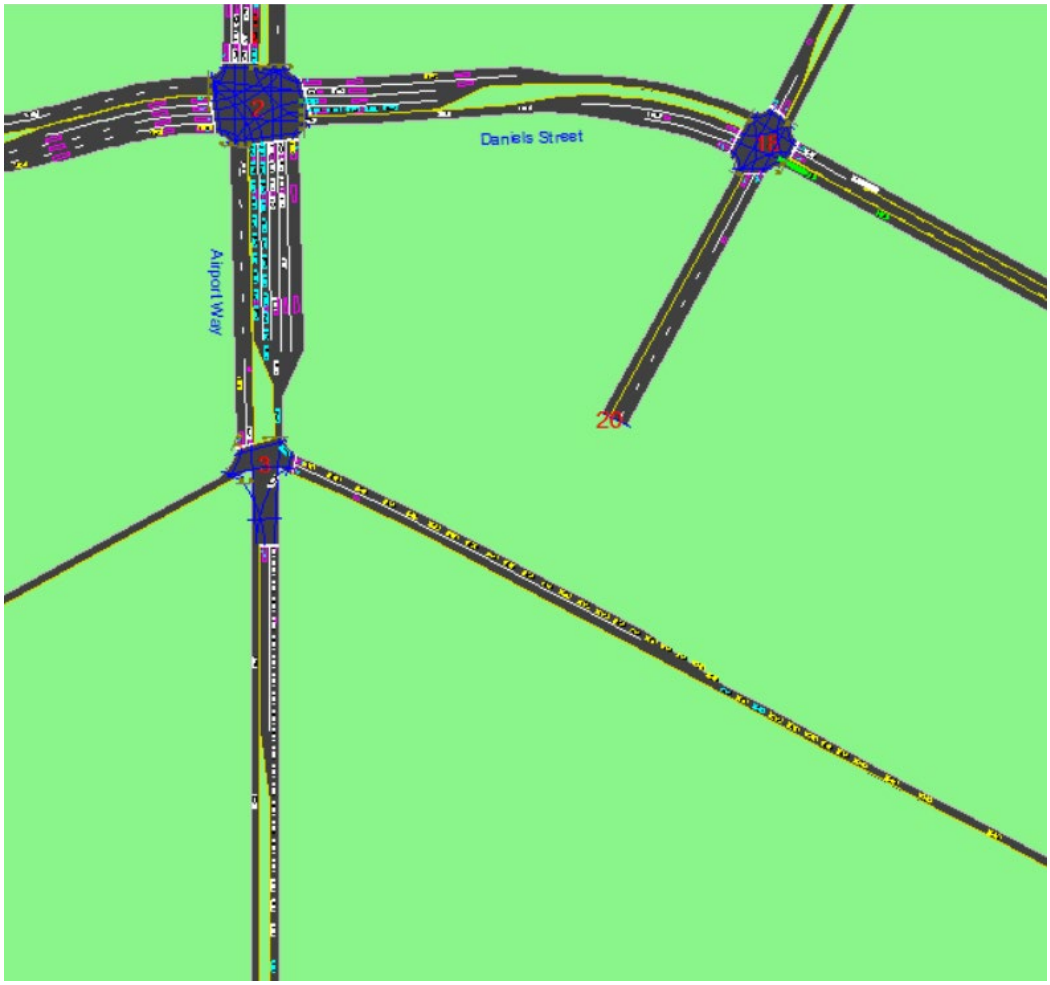
Table 4 displays the AM and PM peak hour intersection operations under Existing Plus Project conditions. Technical calculations are displayed in **Appendix A**. Improvements identified in the PFIP were not included in the Existing Plus Project analysis.

Table 4: Intersection Operations – Existing Plus Project Conditions

Intersection	Control Type	Existing Conditions				Existing Plus Project Conditions			
		AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
		Delay[1]	LOS	Delay[1]	LOS	Delay[1]	LOS	Delay[1]	LOS
1. Airport Way/Wawona Street	SSSC	4 (12)	A (B)	7 (33)	A (D)	5 (15)	A (C)	5 (32)	A (D)
2. Airport Way/Daniels Street	Signal	26	C	39	D	32	C	45	D
3. Airport Way/Westbound SR 120 Ramps	Signal	17	B	24	C	19	B	**58**	**E**
4. Airport Way/Eastbound SR 120 Ramps	Signal	30	C	26	C	34	C	26	C
5. Daniels Street/Milo Candini Drive	Signal	3	A	9	A	4	A	9	A
6. Daniels Street/Starbucks Driveway	SSSC	3 (6)	A (A)	5 (13)	A (B)	3 (6)	A (A)	5 (14)	A (B)
7. Airport Way/Project Driveway #1	SSSC	-	-	-	-	3 (7)	A (A)	4 (15)	A (C)
8. Daniels Street/Project Driveway #2	SSSC	-	-	-	-	2 (4)	A (A)	2 (6)	A (A)

Notes: SSSC = Side-Street Stop Control; LOS = Level of Service. **Bold** indicates deficient operations.
[1] For signalized intersections, average intersection delay is reported in seconds per vehicle for all approaches. For side street stop-controlled intersections, intersection delay is reported in seconds per vehicle for the overall intersection and (worst-case) movement. Intersection delay is calculated based on the procedures and methodology contained in the Highway Capacity Manual 7th Edition (Transportation Research Board, 2022).
Source: Fehr & Peers, 2022

As displayed in **Table 4**, all study intersections currently operate acceptably. However, with the addition of project trips, the Airport Way/Westbound SR 120 Ramps intersection operates deficiently.



This SimTraffic screenshot shows the PM peak hour northbound queue on Airport Way spilling back from Daniels Street to the westbound SR 120 ramps under Existing Plus Project conditions. However, the off-ramp queue would not spill back to the mainline.

Signal optimization at Intersection 2 (Airport Way/Daniels Street) is recommended. By shifting 7 seconds of green time from the southbound through movement to the northbound left-turn movement at Intersection 2 and reducing the westbound left-turn green time by 1 second the northbound and westbound queueing at Intersection 3 (Airport Way/Westbound SR 120 Ramps) is reduced. With this improvement, the LOS at Intersection 3 is improved from E to D, and all study intersections would operate acceptably. **Table 5** displays PM peak hour intersection operations with the recommended improvement. **Table 6** shows peak hour queuing for several turn movements under existing conditions, existing plus project conditions, and existing plus project conditions with improvements. As shown, the signal timing change would substantially reduce queueing on the SR 120 westbound off-ramp. However, queues would continue to exceed the available storage in the northbound left-turn lane at Daniels Street.

Table 5: Intersection Operations – Existing Plus Project Conditions with Improvements

Intersection	Control Type	Existing Plus Project Conditions with Improvements (PM Peak Hour)	
		Delay[1]	LOS

7. Cumulative Conditions Analysis

This chapter presents the results of intersection operations analysis under cumulative conditions. The analysis reflects long-term development in the City of Manteca and other nearby jurisdictions using the Cumulative Year TFM previously described.

Intersection lane configurations, traffic controls, and roadway improvements identified in the City of Manteca PFIP were assumed to be constructed. This results in modifications at the following locations:

- **PFIP Improvements**:
  - Widening of Airport Way to six lanes between Yosemite Avenue and Daniels Street
  - Airport Way/Yosemite Avenue intersection expansion and signal modification
  - New signal and addition of storage lanes at the Airport Way/Wawona Street intersection
- **SJCOG RTP/SCS Improvements**:
  - Reconstruction of the SR 120/Airport Way interchange. The design has not been formalized; A reconstructed partial cloverleaf interchange was assumed for the purpose of this analysis.
  - New interchange at SR 120/McKinley Avenue
  - Connected Daniels Street to McKinley Avenue
  - Widening of SR 120 to three lanes in both directions
  - Widening of Airport Way to six lanes between SR 120 and Lathrop Road

7.1 Cumulative No Project Intersection Operations

Figure 9 displays AM and PM peak hour turning movements and lane configurations at the study intersections under Cumulative No Project conditions. **Table 7** displays the AM and PM peak hour intersection operations. Technical calculations are displayed in **Appendix A**. As displayed, with improvements identified in the PFIP and the SJCOG RTP/SCS, all study intersections would operate acceptably during the AM peak hour, but only one of the six would operate acceptably during the PM peak hour.

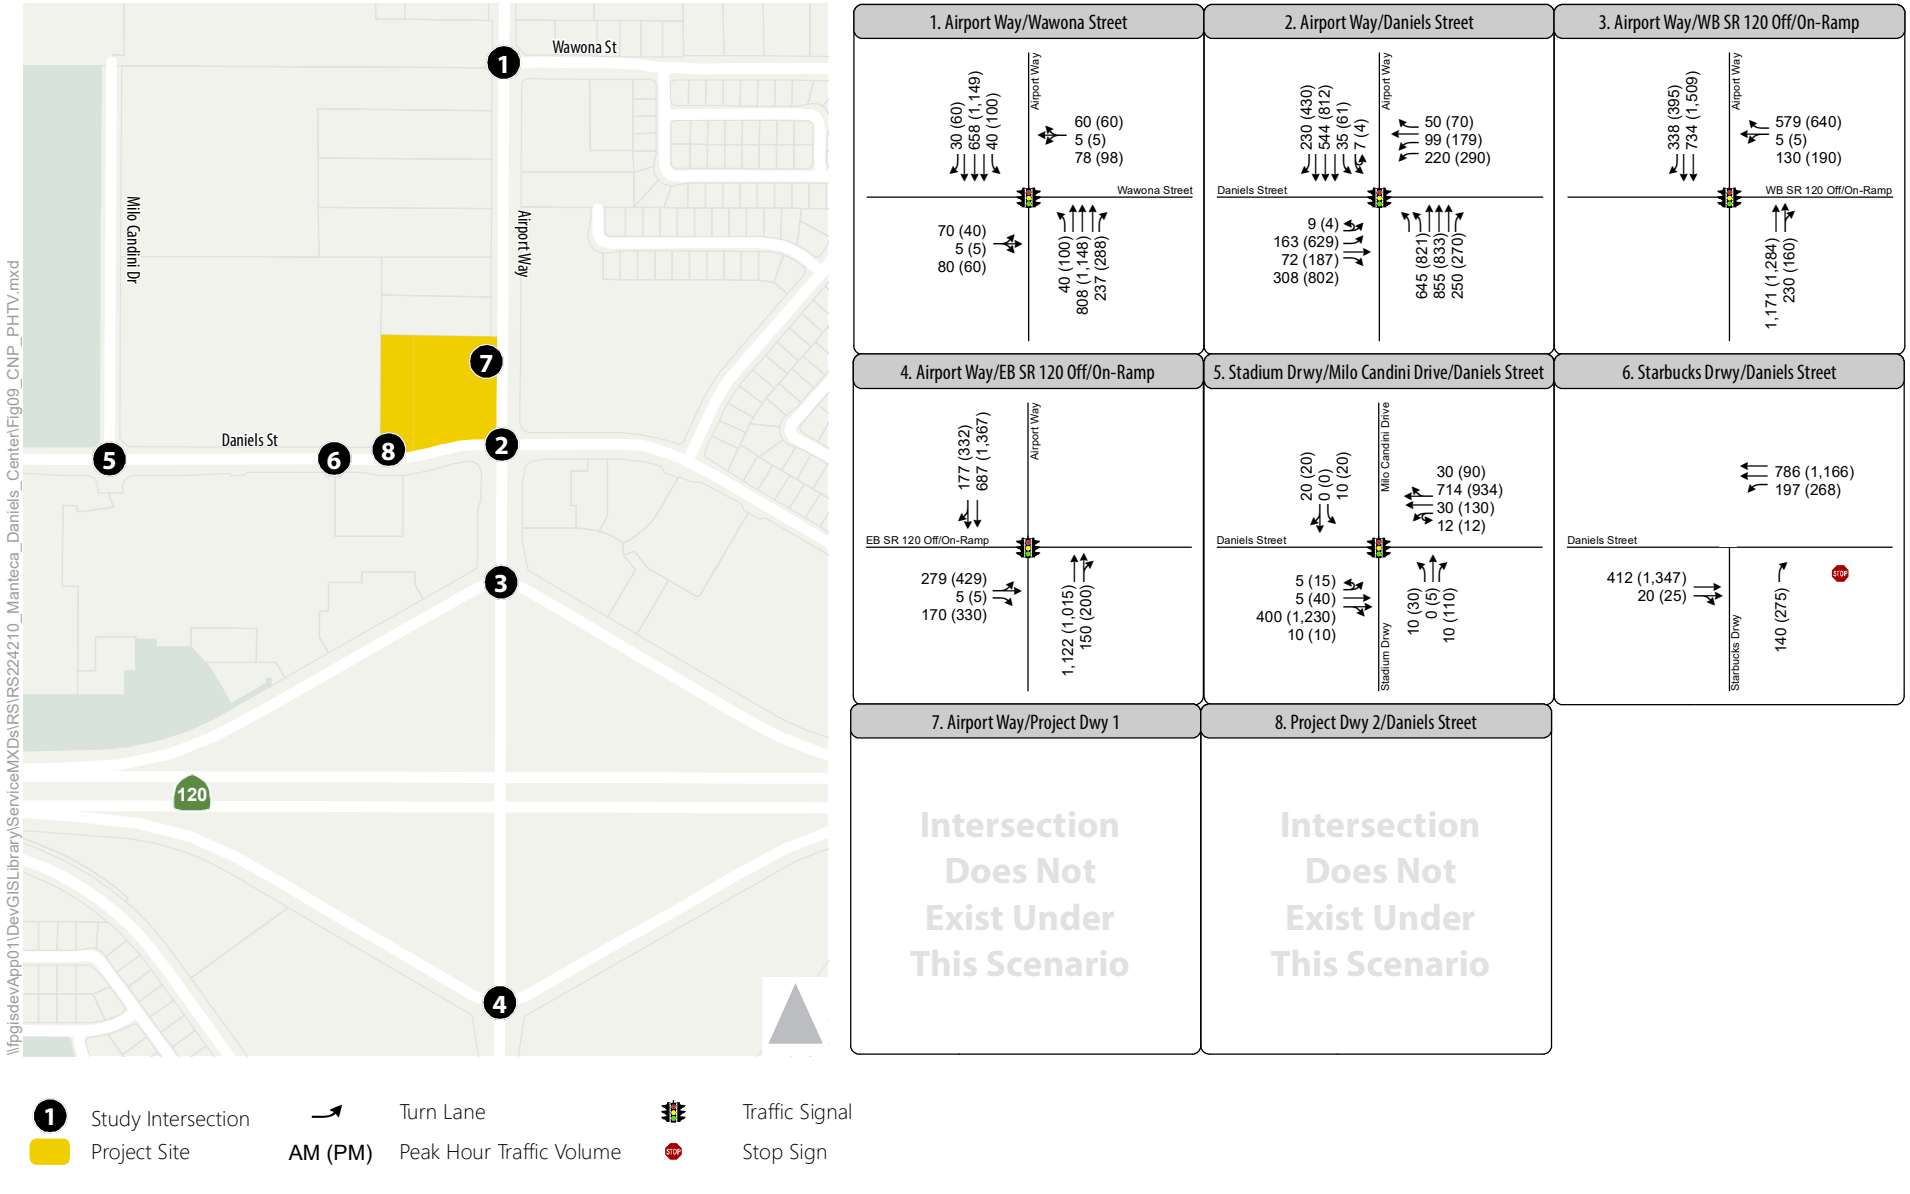

Figure 9

Peak Hour Traffic Volumes and Lane Configurations - Cumulative No Project Conditions

Table 7: Intersection Operations – Cumulative No Project Conditions

Intersection	Control Type	AM Peak Hour		PM Peak Hour	
		Delay[1]	LOS	Delay[1]	LOS
1. Airport Way/Wawona Street [2]	Signal	23	C	26	C
2. Airport Way/Daniels Street [2]	Signal	36	D	**107**	**F**
3. Airport Way/Westbound SR 120 Ramps [2]	Signal	33	C	**125**	**F**
4. Airport Way/Eastbound SR 120 Ramps [2]	Signal	11	B	**82**	**F**

[1] Average signalized intersection delay is reported in seconds per vehicle for all approaches. Intersection delay is calculated based on the procedures and methodology contained in the Highway Capacity Manual 7th Edition (Transportation Research Board, 2022).
[2] Intersection lane configuration and/or traffic control are different from Existing Conditions due to planned intersection and roadway improvements.
[3] The future interchange design has not been formalized. Delay and LOS are estimated using a partial-cloverleaf interchange configuration and are subject to change.
[4] >300 seconds = volume inputs exceed model's ability to produce reasonable delay outputs.
Source: Fehr & Peers, 2022

Based on the Cumulative Year model results, PM peak hour traffic on Airport Way south of Daniels Street would increase by 83% comparing to Baseline (2019) conditions. Similarly, on Daniels Street west of Airport Way the increase would be about 72%. The trip increase is caused by the amount of land use growth near the project site along Daniels Street and Airport Way. There are multiple new industrial, office and retail projects along these segments under Cumulative conditions, which increased the total number of employees by about 6,000.

Under Cumulative No Project conditions, the northbound left-turn queue is exacerbated due to a demand of 821 PM peak hour vehicles in two left turn lanes, which exceed its capacity. This would result in upstream queuing that spills back beyond the study ramp terminal intersections, resulting in LOS F operations at Intersections 3 and 4 during the PM peak hour. Similarly, the Cumulative No Project eastbound approach queue at Intersection 2 would result in upstream queuing that spills back to study intersections 5 and 6 during the PM peak hour. As a result, Intersections 5 and 6 would operate at LOS F.

It should be noted that the design of the SR 120/Airport Way interchange improvement has not been formalized; however, traffic operation of the future interchange will be studied in detail as part of the upcoming SR 120/Airport Way Interchange Improvement Project led by the City of Manteca, in coordination with Caltrans. The Cumulative Year (2040) Scenario TFM will be modified to include the proposed Daniels Center and used to develop traffic volume forecast.

7.2 Cumulative Plus Project Intersection Operations

The Cumulative Year traffic forecasting model was also used to develop Cumulative Plus Project trip distribution and forecasts. The cumulative project trip distribution was determined to be similar to the existing plus project trip distribution (seen in Figure 7), with over 50% southerly on Airport Way toward and through the interchange at SR 120.

Figure 10 displays AM and PM peak hour turning movements and lane configurations at the study intersections under Cumulative Plus Project conditions. **Table 8** presents the results of the Cumulative Plus Project intersection operations analysis. Technical calculations are displayed in **Appendix A**. As shown in the table below, Intersections 2-6 would continue to operate at LOS F during the PM peak hour and Intersection 3 would worsen from LOS C to LOS E in the AM peak hour with the addition of project trips. Intersection delay would increase at most study intersections under the Cumulative Plus Project conditions.

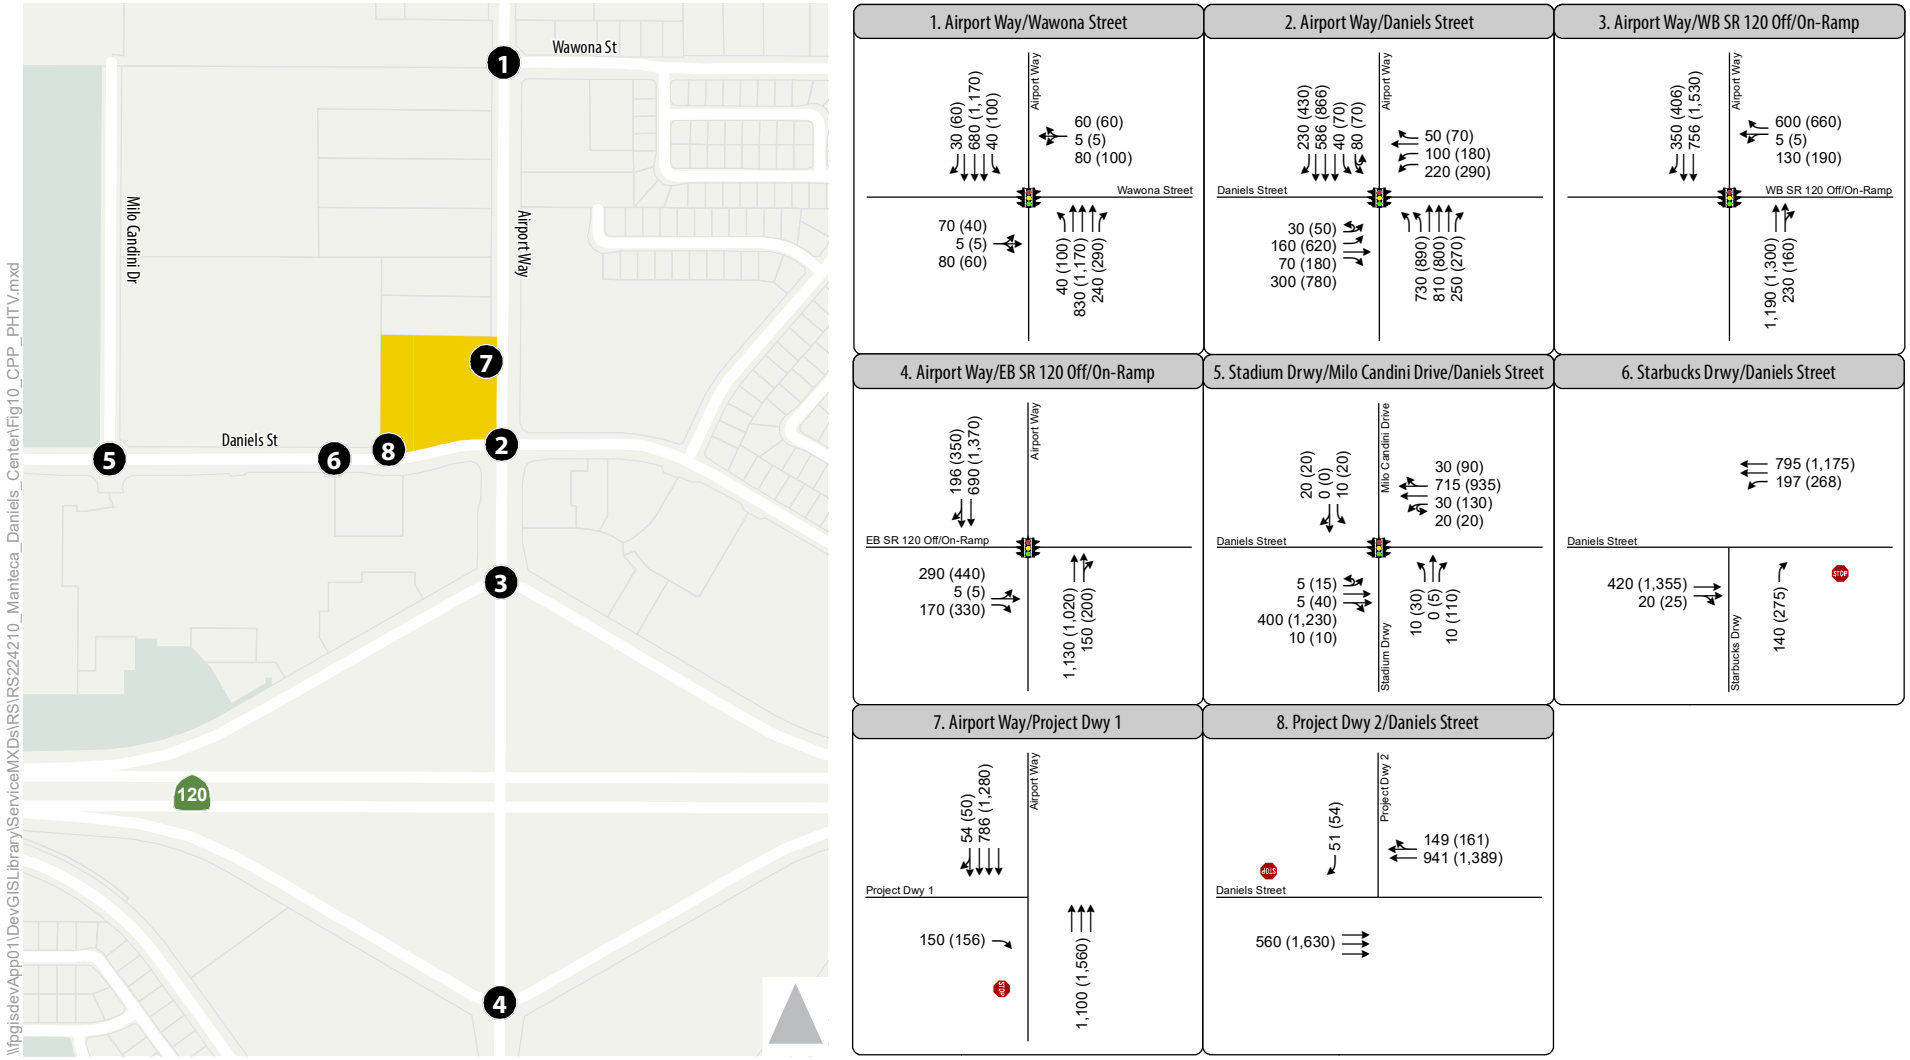

Figure 10

Peak Hour Traffic Volumes and Lane Configurations - Cumulative Plus Project Conditions

[4] >300 seconds = volume inputs exceed model's ability to produce reasonable delay outputs.
Source: Fehr & Peers, 2022

With the addition of project trips, the Airport Way/Westbound SR 120 Ramps intersection would begin to operate deficiently in the AM peak hour. In the PM peak hour, Intersections 2 through 6 would see increased delays and remain at LOS F. The following improvements would improve operations at all study intersections. **Table 9** shows the LOS results under Cumulative Plus Project conditions with the following potential improvements:

Intersection 2 (Airport Way/Daniels Street)

- Signal coordination between Intersections 2 and 3.
- Slightly reduce the maximum green extensions for the eastbound through and westbound through phases.
- Restripe the northbound approach at Intersection 2 to provide 3 left-turn, 2 through, and 1 right-turn lanes. This would require modifying the west leg to have 3 receiving lanes on Daniels Street. The inside receiving lane would be a "trap lane" to the westbound left-turn lane at Intersection 6 (Daniels Street/Starbucks Driveway).
- Adjust signal phasing by shifting the southbound left-turn phase to occur after the northbound through phase (i.e., convert the southbound left-turn phase to a lag phase).
- Adjust signal phasing by converting the westbound left-turn and eastbound left-turn phases to occur after the eastbound/westbound through phases (i.e., convert eastbound/westbound left-turn phases to lag phases).

Intersection 3 (Airport Way/Westbound SR 120 Ramps)

- Optimized geometrics (based on travel demands) were assumed, though it is noted that final configurations will not be determined until the SR 120/Airport Way interchange study is completed.

The above improvements are intended to provide increased capacity and a greater proportion of overall intersection green time to the heavy northbound left-turn movement at Intersection 2. However, there are drawbacks to converting the northbound inside (#1) travel lane on Airport Way at Daniels Street to a trap left-turn lane. Upcoming lane positioning (and wayfinding) could be a challenge given the short distance between the interchange and Daniels Street. It is atypical for the inside lane of a major arterial to have a lane drop so close to an interchange. More studies are warranted before considering implementation of this type of improvement.

Additionally, the extension of Wawona Street to connect with Milo Candini Drive was not assumed under cumulative conditions because it is not listed in the City of Manteca PFIP. However, based on recent projects in the City, the connection of Wawona Extension and Milo Candini Drive is likely to exist under cumulative conditions. With this connection, project trips going to the north may use project Driveway 2 (Intersection 8) instead of project Driveway 1 (Intersection 7). Instead of taking the southbound U-turn at Airport Way/Daniels Street (Intersection 2) to travel to the north, the vehicles exiting the project may take the southbound right turn from project Driveway 2 (Intersection 8), travel on Milo Candini Drive and Wawona Street, and take the eastbound left to Airport Way. This roadway connection may reduce the project trips at Intersection 2 and Intersection 7, and thus may also reduce the delay at these intersections.

With implementation of the potential improvements, intersection operations at Intersection 3 would improve from LOS E to LOS C during the AM peak hour. All intersections would operate acceptably in the AM peak hour. In the PM peak hour, Intersections 2, 3, 5, and 6 would continue to operate at LOS F, but delays would be reduced to or below Cumulative No Project levels.

Table 9: Intersection Operations – Cumulative Plus Project with Improvements Conditions

Intersection	Control Type	Cumulative Plus Project Conditions				Cumulative Plus Project with Improvements Conditions

8. Site Access and Internal Circulation Evaluation

This chapter includes a review of project access and internal circulation.

8.1 Project Driveways

It is important that driveways be designed with adequate storage to accommodate outbound project trips. An inadequate driveway throat depth could block the flow of inbound traffic, thereby causing vehicles to spillback onto public streets, which can have adverse operational and safety consequences.

Table 10 shows the available storage and maximum vehicle queue expected for the outbound movements at each project driveway under existing plus project and cumulative plus project AM and PM peak hour conditions.

Table 10: Outbound Driveway Throat Depth Requirements

Driveway	Movement	Available Storage[1]	Maximum Vehicle Queue [2] - Weekday AM Peak Hour (EPP & CPP Conditions)	Maximum Vehicle Queue [2] - Weekday PM Peak Hour (EPP & CPP Conditions)
Driveway 1 (Airport Way)	Outbound Right	25 feet	**125 feet, 5 vehicles**	**125 feet, 5 vehicles**
Driveway 2 (Daniels Street)	Outbound Right	150 feet	75 feet, 3 vehicles	75 feet, 3 vehicles

Notes:
1. Per project site plan.
2. Estimated using methodology described in *Estimation of Maximum Queue Lengths at Unsignalized Intersections* (ITE Journal, 2001).

Bolded font represents a maximum queue that exceeds the available storage.
Source: Fehr & Peers, 2022.

As the table shows, maximum vehicle queues exiting Driveway 1 would exceed the available on-site storage during both peak hours. However, the considerable width of the driveway and the large amount of paved area within the project site near the driveway suggests that motorists will be able to navigate within the site to avoid queued outbound traffic. The site plan is not well-suited for a reconfiguration that would introduce a raised median (or similar treatment) to create an increased amount of throat depth for outbound vehicles.

Fehr & Peers recommends the following at the two project driveways:

Driveway 1 on Airport Way

- To prohibit left-turn ingress and egress movements, the median of Airport Way in the driveway vicinity should be modified to provide a narrow raised median, channelizers, bollards, or the equivalent (see Figure 11 for limits).
- Post "No U-Turn" sign facing northbound Airport Way traffic at the very north edge of the area featuring median modifications near Driveway 1.

Driveway 2 on Daniels Street

- Construct a 150-foot right-turn turn pocket on westbound Daniels Street at Driveway 2 to accommodate the heavy ingress movement (160 vehicles during PM peak hour).
- Post "No U-Turn" sign in the median of the westbound left-turn lane on Daniels Street to the Stadium Center Retail Plaza.

While it would be desirable for the project to also include a right-turn deceleration lane on southbound Airport Way at Driveway 1, this is not considered feasible given the driveway's location relative to the north property boundary.

The above recommendation includes flexibility regarding the type of treatment that would be situated in the Airport Way median. This is because of the strong likelihood that any improvements would ultimately be "throw-away" once the final corridor widening is complete.

Coordination with City staff will be necessary to determine if any specific, temporary striping modifications are warranted along the project's frontage along Airport Way. If the driveway were constructed in the proposed location and no striping modifications were made, it is conceivable that some motorists may pull forward 25 feet or so beyond the driveway to the striped edge of the outside travel lane to wait and then merge with stopped traffic on southbound Airport Way. At that point, an oncoming southbound motorist will visualize a vehicle stopped in the roadway pavement to be in a direction perpendicular to the flow of traffic. One way of preventing this would be to require restriping of the southbound travel lanes to include one left-turn lane, three through lanes and one right-turn lane along the entirety of the project frontage. There is a short outside (#3) receiving lane on Airport Way south of Daniels Street. If this restriping were to occur, lengthening of that turn lane (using available pavement) would likely be necessary.

8.2 Bicycle and Pedestrian Access

Sidewalks are currently on the project frontage, but do not extend past project frontage on Airport Way. There is an existing 5-foot-wide sidewalk on the north side of Daniels Street and an 8.5-foot-wide sidewalk on the west side of Airport Way along the project frontage. The site plan shows one walkway connecting the sidewalk on Airport Way to the car wash and associated parking spaces, and another walkway from Daniels Street to the proposed fast-food restaurant and convenience store. Internally, a marked path from the parking spots directly south of the car wash tunnel to the convenience store is

present. The provision of a separate pedestrian circulation system is consistent with the standards in Manteca Municipal Code section 17.52.090.

The six bicycle parking spaces on the site plan are generally provided in accessible locations and meet the requirements in the Manteca Municipal Code section 17.52.110 for bicycle parking to "be located on a paved surface, in proximity to a building entrance, and in a visibly secure location adjacent to the building."

There are currently no bike lanes on Airport Way or Daniels Street. Based on characteristics of the proposed project and its surrounding environment, the following improvements to project-serving pedestrian and bicycle facilities are recommended:

- As identified in the City of Manteca PFIP, construct a Class II bike lane along the project frontage on Airport Way.

8.3 Internal Circulation

On-Site Circulation

The proposed project parking lot meets Manteca Municipal Code Parking and Driveway Design and Development Standards (17.52.090) related to curb cuts, drive aisle widths, and stall sizes, as listed in Chapter 3. Drive aisles in the proposed project parking lot are between 25 and 34 feet wide, while parking stalls are at least 19 feet long by 9 feet wide for typical spaces, and at least 16 feet long by 8 feet wide for compact stalls.

Fehr & Peers recommends the following:

- Add "Yield" sign at the car wash exit near Driveway 1 so vehicles will yield to traffic entering/exiting from Driveway 1.
- Post wayfinding sign facing the exit of the fast-food drive-through lane showing a directional arrow (toward Driveway 1) to access Airport Way and Highway 120.

Car Wash Vehicle Stacking

Field observations were conducted at a retail center situated at 3950 Truxel Road in City of Sacramento, which featured a fast food restaurant and Chevron Gas Station with car wash drive-through. Observations were collected during peak conditions of 1:00 to 2:00 PM on Saturday, October 15, 2022. The maximum queue observed waiting to enter the car wash tunnel was three vehicles. While the specific users and demand of the car wash at the project site are unknown, the project site plan does not indicate that it would not be a standalone facility. Thus, car wash travel demand at the project site could be similar to what was observed at the Truxel Road site. Since the project site plan shows queuing for four vehicles without blocking the east-west drive aisle, queuing problems are not expected in the car wash drive-through lane under normal conditions. The available storage exceeds the City requirement of 60 feet.

Fast-Food Restaurant Vehicle Stacking

A specific tenant for the fast-food restaurant has not been identified; however, Fehr & Peers has been advised that it could be a Burger King or similar fast-food restaurant. Based on the "popular times" information from Google Maps, field observations were conducted during the "lunch rush" (11:30 AM to 1:30 PM) on Friday, September 16, 2022 at two fast-food restaurants with drive-through lanes. One location was a Burger King in City of Lathrop at the southeast corner of the W Lathrop Rd/I-5 Ramps and the other was a Taco Bell in City of Manteca at the northeast corner of the Airport Way/SR 120 interchange. Both locations are close to freeways, similar to the proposed project.

A maximum queue of 10 vehicles was observed at Taco Bell and 11 vehicles were observed at Burger King. The original site plan showed approximately 180 feet of stacking space, which met the City of Manteca Municipal Code requirement for stacking space. Fehr & Peers recently conducted studies documenting the average space occupied per stacked vehicle is about 23 feet. This equates to 8 vehicles could be stacked within the 180 feet of storage that was provided on the original site plan (note the site plan showed 9 cars). If the proposed fast-food restaurant has similar travel demands and operating characteristics to the two restaurants that were surveyed, it is likely that two or three vehicles will queue within the east-west drive aisle. This could have resulted in temporary blockage of several nearby parking spaces. However, the vehicles would not have blocked ingress to the car-wash drive-through. This temporary queue exceedance would have occurred deep within the project site, not affecting driveway access or circulation near the gas station pumps. However, based on the recent studies of similar facilities demonstrating that a maximum queue of 11 vehicles is likely in the fast-food drive-through, City staff required the applicant to modify the drive-through lane to provide 250 feet of vehicle storage (11 vehicles x 23 feet per vehicle = 250 feet). The revised drive-through is sufficient to accommodate the maximum queue seen at the study restaurants.

The project site plan shows what appears to be a planned, future reciprocal access to the property immediately to the west near the drive-through lane entrance to the fast-food restaurant and car wash. As part of the draft report, Fehr & Peers described concerns about this northern access easement which could become congested at times as it serves as the drive-through lane entry point. City staff has clarified that access to the property on the west will be through the south easement, and access on the north will not be provided.

9. Recommendations

This chapter presents the conclusions of the transportation impact analysis for the proposed Daniels Center Project in the City of Manteca.

9.1 Vehicle Miles Traveled Screening Analysis

In accordance with the OPR *Technical Advisory*, the project would satisfy the local-serving retail VMT screening criteria by virtue of the nature and size of the project. The project can reasonably be described as a "local-serving" business that would improve commercial destination proximity. Therefore, no quantitative VMT analysis or associated mitigation measures are required for transportation purposes, and the project can be presumed to have a less than significant impact on VMT.

9.2 Intersection Operations Analysis

Results of the intersection operations analysis indicate that the addition of project trips to the Airport Way/Daniels Street intersection would cause further queue spillback in the dual northbound left-turn lanes, which would exacerbate queuing on the SR 120 westbound off-ramp at Airport Way. To correct this condition, the following is recommended:

- The project applicant should work with the City of Manteca to modify signal timings at the Airport Way/Daniels Street intersection to provide a greater proportion of overall intersection signal green time to the northbound left-turn movement.
- The project applicant should lengthen the southbound left-turn lane at the Airport Way/Daniels Street intersection from 150 to 275 feet by restriping the existing median pavement.

The signal retiming would substantially reduce queuing in the northbound left-turn lanes, but not to the extent that traffic would not continue to spill back to the SR 120 westbound ramps. The project would not cause westbound off-ramp traffic to spill back onto the SR 120 mainline.

Coordination with City staff is recommended to determine if any lane striping modifications are warranted along the project's frontage along Airport Way. Section 8.1 discusses the potential need for and configuration of such a restriping.

Under cumulative conditions, the Airport Way/Daniels Street intersection is projected to operate deficiently as a result of substantial land use and traffic growth in the area. A potential improvement scenario was tested, which provided moderate operational benefits. Further study of it would be required before implementation should be considered.

9.3 Recommended Project Access and Site Access Improvements

Fehr & Peers recommended the following (see Chapter 8 for details and **Figure 11** for illustration of recommendations):

- To prohibit left-turn ingress and egress movements at Driveway 1, the median of Airport Way in the driveway vicinity should be modified to provide a narrow, raised median, channelizers, bollards, or the equivalent (see Figure 11 for limits).
- Post "No U-Turn" sign facing northbound Airport Way traffic at the very north edge of the area featuring median modifications near Driveway 1.
- Construct a 150-foot right-turn deceleration lane on westbound Daniels Street at Driveway 2.
- Post "No U-Turn" sign in the median of the westbound left-turn lane on Daniels Street to the Stadium Center Retail Plaza.
- Add "Yield" sign at the car wash exit near Driveway 1 so vehicles will yield to traffic entering/exiting from Driveway 1.
- Post wayfinding sign facing the exit of the fast-food drive-through lane showing a directional arrow (toward Driveway 1) to access Airport Way and Highway 120.
